Streaming Ingestion
Quick Start

Streaming Ingestion is a component of the Data Ingestion service that runs in Informatica Intelligent Cloud Services.

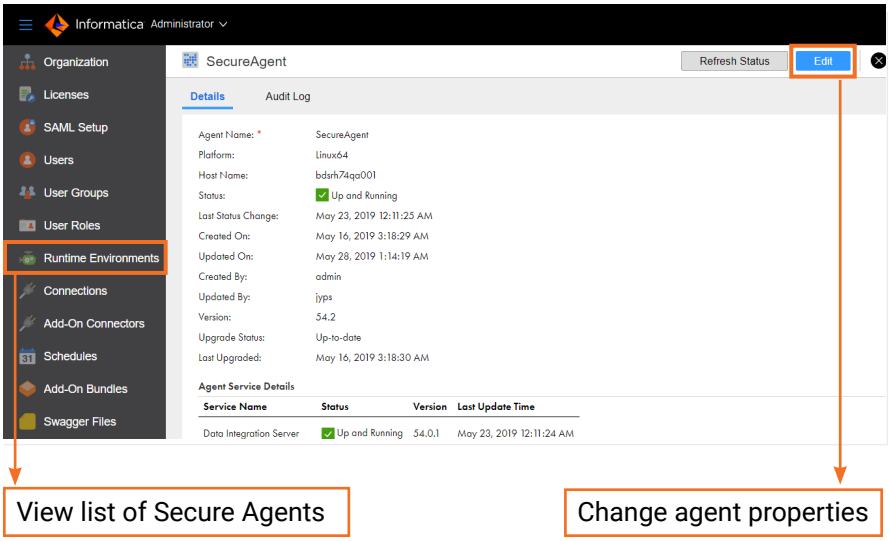

Use Streaming Ingestion to ingest high-volume, real-time data from streaming and IoT sources into on-premise and cloud storage. The supported sources are event logs, Apache Kafka, and MQTT. The supported targets are Amazon Kinesis, Apache Kafka, and Amazon S3.

Use this quick start to create a streaming ingestion task, deploy the task, and then monitor the associated job.

Configure the Streaming Ingestion Agent

Using Administrator:

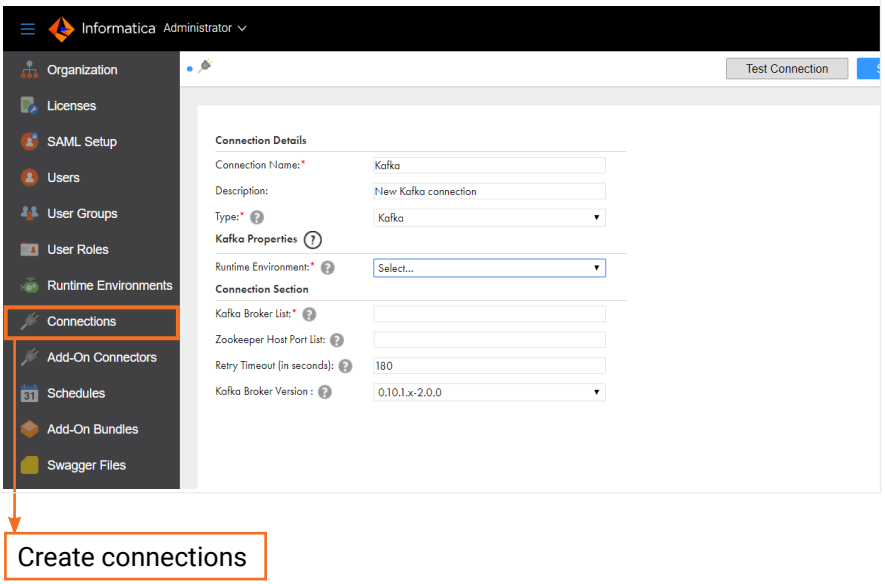

1. Download and install the Secure Agent, and then register the agent.

   Learn about installing Secure Agents here.

2. Optionally, configure the Secure Agent properties for your runtime environment.

   Learn more about the Streaming Ingestion agent here.

Create connections for sources and targets

Using Administrator:

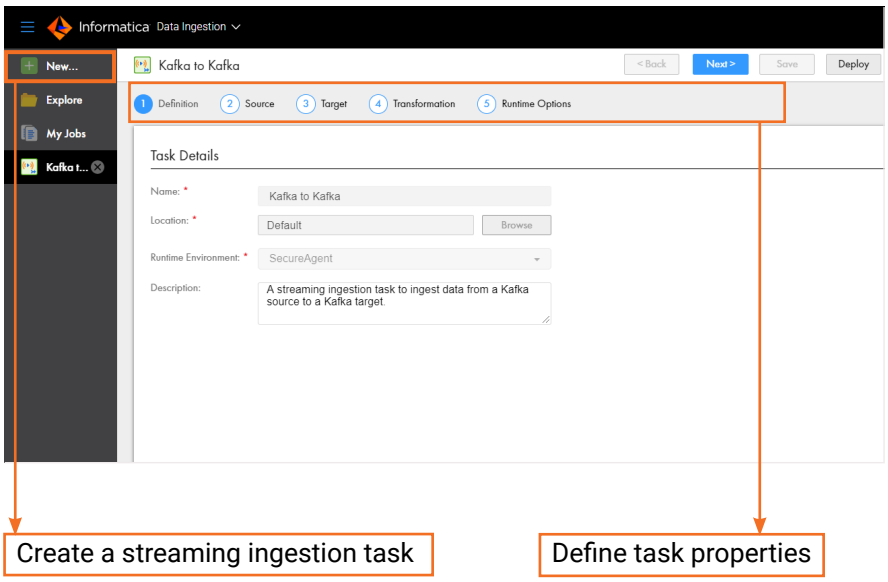

1. On the Connections page, click **New Connection**.
2. Enter the connection details for your source or target type.
3. Test the connection, and then save it.

Before you create a connection, verify that the connectors for your sources and targets are available in Informatica Intelligent Cloud Services.

Learn about the list of supported connectors here.

Create a streaming ingestion task

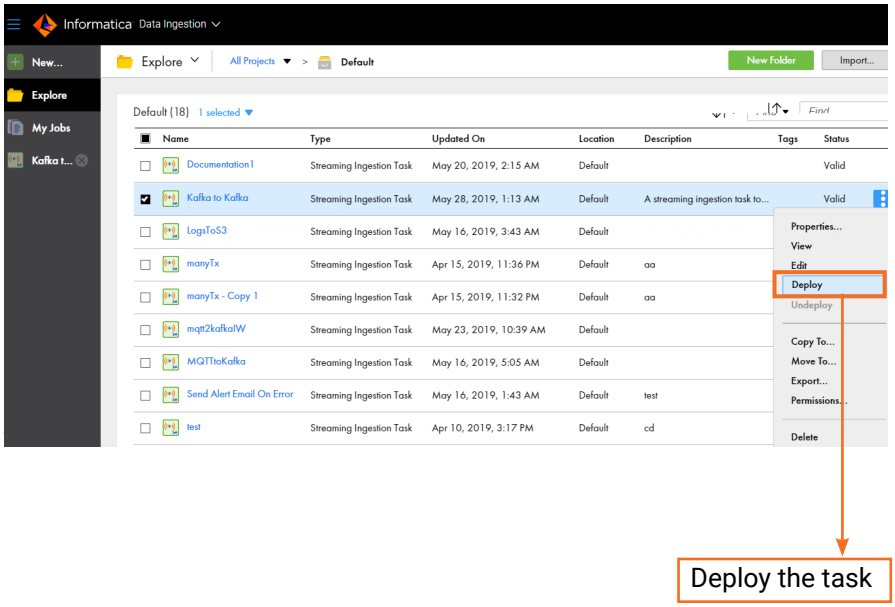

Using Data Ingestion:

1. Define a streaming ingestion task.
2. Configure a source.
3. Configure a target.
4. Optionally, configure a transformation.
5. Optionally, configure the runtime options for the ttask.

Learn about creating a streaming ingestion task here.

Deploy the streaming ingestion

Using Data Ingestion:

Deploy the streaming ingestion task on the Secure Agent for processing.

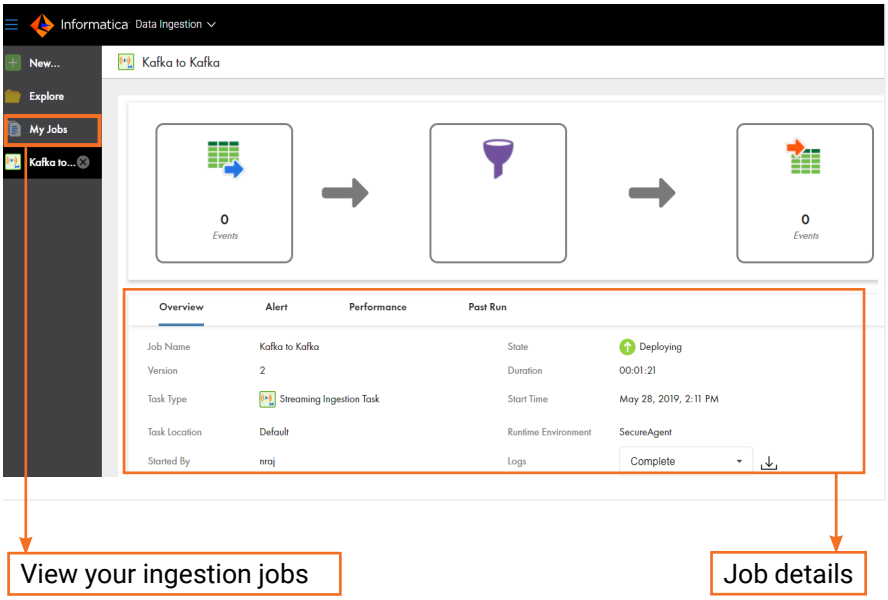

To deploy the streaming ingestion task, perform one of the following tasks:

- After you save the task, click **Deploy**.
- On the **Explore** page, open the project that contains the task, click **Actions** against the task, and then click **Deploy**.

Learn about deploying a streaming ingestion task here.

Monitor the streaming ingestion job

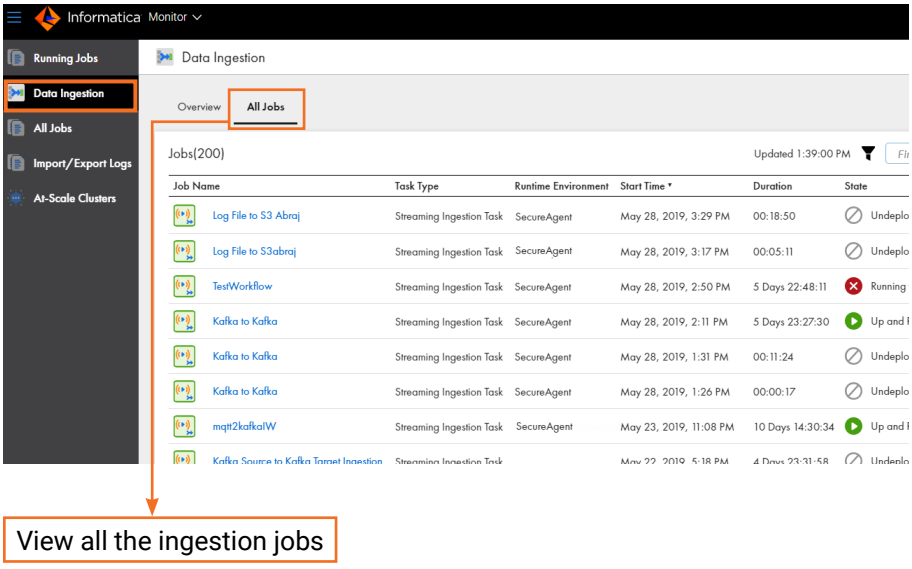

Using Data Ingestion:

1. Click **My Jobs**.
   You can view a list of the tasks that you deployed and their properties.
2. Select the streaming ingestion job that you want to monitor.
   You can view detailed information about the selected job.

Learn more about monitoring your streaming ingestion jobs here.

Monitor Data Ingestion jobs

Using Monitor:

On the **Data Ingestion** page, monitor all the streaming ingestion and database ingestion jobs that the users deployed from the Data Ingestion service.

Learn more about monitoring all Data Ingestion jobs here.
