Preface

Read *Introduction and Getting Started* to understand how to begin using Data Governance and Catalog to govern the data in your organization.

CHAPTER 1

Introduction

Data Governance and Catalog helps you understand, analyze, interpret, and govern large volumes of data in your organization. Metadata Command Center in IDMC℠ extracts metadata from different types of source systems such as databases, data integration resources, and data warehouses. Data Governance and Catalog displays the extracted metadata and its attributes as a comprehensive catalog.

You can organize the metadata, view how data flows from one system to another, and see relationships and links between the data assets. You can add business context to technical assets, and govern the data according to the security and compliance requirements of your organization.

You can use Data Governance and Catalog to perform the following tasks:

- Find data across your organization using search features.
- View attributes, profiling, and classification information for the data.
- See the lineage of the data, transformations for the metadata assets, and the start and end points for the metadata assets.
- Create links between technical assets and their business contexts.
- Create relationships between metadata assets.
- Assign stakeholders to assets by specifying users and user groups as responsible entities.
- Collaborate with users by requiring a workflow when they want to create or modify assets.
- Develop actionable data access policies and rules that grant access to, filter, or de-identify data in your source systems.

Business activities

Using Data Governance and Catalog, you can perform the following types of business activities.

Business activity	For more information
Control how users interact with the assets in your organization by using metadata access control.	See the *Asset Management* help.
Browse or search for assets in your organization by building complex queries using easy text constructions. Save a search if you use it frequently and share the saved search with others in your organization.	See the *Asset Discovery* help.

Business activity	For more information
Track and monitor key assets in your organization using dashboards. Create separate dashboards for different business themes, share the dashboards with others, and pin widgets to the dashboards to view the latest data quality values and scores.	See the *Asset Discovery* help.
Catalog, discover, and classify unstructured data alongside your structured data assets to create a unified catalog for all your organizational data.	See the *Understanding technical assets* help.
Check out a business policy to see if it is in use or has expired, and verify that the latest documents are made available to users in your organization.	See the *Understanding business assets* help.
See the stakeholders that are responsible for a particular asset so that you can contact them.	See the *Understanding business assets* help.
Engage stakeholders and collaborators as you modify the properties of a system. Use a workflow to approve your changes before they are published and made available to everyone.	See the *Asset Management* help.
If a table is used extensively in your organization, get a comprehensive view of all systems that access the table. View the table lineage to see the flow of data and to identify process changes and transformations that are applied to the data.	See the *Asset Discovery* help.
Enable efficient, effective, and responsible data use by building policy-based data access controls that grant access to, filter, or de-identify data.	See the *Data Access Management* help.

Asset types

In Data Governance and Catalog you can create an asset repository, add business or technical metadata to enrich the data in your source systems, and display the data assets.

You can view the following types of assets in Data Governance and Catalog:

Technical assets

Data Governance and Catalog shows the metadata you extract from source systems in Metadata Command Center as technical assets. You can use technical assets to perform various catalog functions. For example, searching for data using technical parameters, understanding the lineage of the data, and identifying relationships between the assets. Technical assets include catalog sources, data classifications, databases, columns, views, and more.

Business assets

When you document a new asset or add business metadata to your data, you create an asset in Data Governance and Catalog called a business asset. Use business assets to perform governance functions such as collaborating with stakeholders, viewing the audit history of data, and complying with regulatory requirements. Business assets include glossary, policy, domain, data sets, and more.

Data access assets

When you develop actionable policies and rules that grant access to, filter, or de-identify data in your source systems, you create an asset in Data Governance and Catalog called a data access asset. Data access assets consist of data access policies based on defined rules. The rules include data access control policies, data filter policies, and data de-identification policies which leverage metadata context, precedence tiers, and data de-identification techniques. You use data access assets to apply and

enforce these access controls that protect data through multiple methods, including Data Integration mappings when moving data, self-service access to data provided through Data Marketplace, and pushdown of data access control policies into cloud data platforms.

CHAPTER 2

Getting started

You can access Data Governance and Catalog to discover, catalog, and govern the metadata in your organization. You can also customize your user profile and notification settings to tailor your experience.

Prerequisites

To access Data Governance and Catalog, your organization administrator must provide access to the Data Governance and Catalog service. For more information about how the access to assets is managed in Data Governance and Catalog, see the *Manage access to assets* topic in the *Asset Management* help.

Assets in Data Governance and Catalog

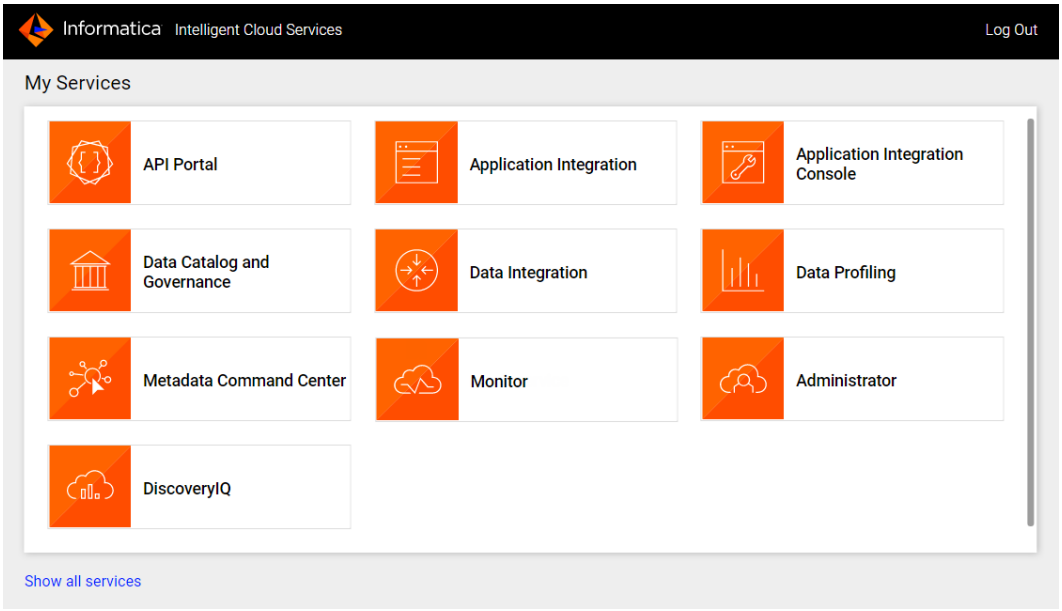

Data Governance and Catalog extracts metadata from your source systems and displays them technical and business assets. You can perform mutliple activities to catalog and govern these assets. You can search, browse, import, and export assets based on your requirements. You can also create new assets, analyze and understand asset lineage, and control the metadata access policies in your organization.

Log in

Log in to Intelligent Data Management Cloud ™ (IDMC), and select Data Governance and Catalog from the **My Services** page.

When you log in to IDMC, the **My Services** page displays the services that your organization is licensed to use. The page also lists common services that are available under the same license, such as Administrator. If your organization has trial licenses for additional services, the page displays the trial services.

The following image shows an example of the **My Services** page:

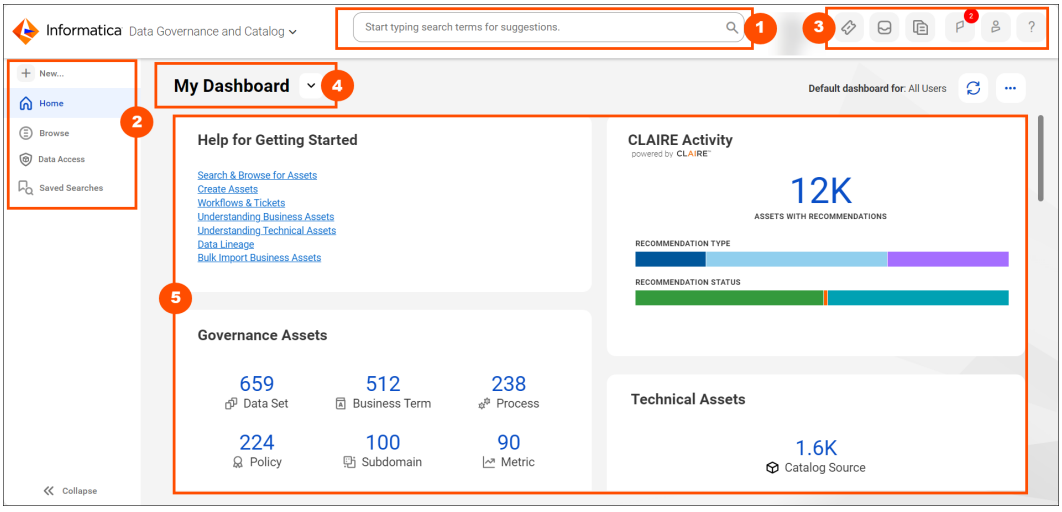

To start using Data Governance and Catalog, click **Data Governance and Catalog**.

Home page

The **Home** page is your entry to Data Governance and Catalog. You can start by searching for a specific asset, browsing the assets by their types, or monitoring the widgets to see the most important information that is relevant for you. You can also view your notifications so that you can take relevant actions.

The following image shows an example home page with multiple widgets and dashboards:

1. Search box. Search for technical or business assets using keywords or queries.
2. Collapsible panel. Create or import new business assets, open **Home** page, browse by asset type, and view your saved searches.

The following table describes the icons that appear on the side panel in Data Governance and Catalog:

Icon	Description
	New. Select the business asset type that you want to create, import assets and download the import template, and create a ticket to use a workflow when you create or modify an asset.
	Home. Go to the home page.
	Browse. Browse business and technical assets.
	Data Access. Go to the Data Access Management page, which you use to manage data access policies to control access to your data and protect it.
	Saved Searches. View all the searches you saved, shared with others in your organization, and the saved searches that others shared with you.

3. Header. Other tasks such as ticket workflows, monitoring jobs, viewing notifications, and user settings that are associated with governance activities.
   The following table describes the icons that appear on the header in Data Governance and Catalog :

Icon	Description
	Ticket Manager. View running and completed workflow tickets to create or modify assets.
	Workflow Inbox. View your ongoing and completed tasks.
	Job Monitoring. View current and completed jobs.
	Notification. View all notifications of the system.
	User Settings. View user profile, user settings, and log out.

4. Dashboards. Create one or more dashboards according to various governance or cataloging themes, and add appropriate widgets in each dashboard. You can share dashboards with others in your organization. For example, you can have a dashboard for all policy-related activities in your organization. Another dashboard to monitor the inflow of assets and jobs in the system and another dashboard to highlight people and their activities.
5. Widgets. A widget is a snapshot of assets, jobs, or search queries that are important for your governance or cataloging activities. You can add multiple widgets to a dashboard and customize how you want your widgets to appear.

Import assets

Before you start using Data Governance and Catalog, import technical or business assets so that they can appear in the interface.

You can import a large number of assets into Data Governance and Catalog in the following ways:

- To import technical assets, the organization administrator must configure catalog sources in Metadata Command Center.
- To import business assets, use a bulk upload template file.

For information about the types of assets that can appear in Data Governance and Catalog, see "Asset types" on page 6.

Import technical assets

To import technical assets to Data Governance and Catalog, the organization administrator must configure Metadata Command Center to scan the source systems in your organization.

Metadata Command Center scans the source systems according to the configured schedule, extracts metadata, and sends the metadata to Data Governance and Catalog. Depending on the scan schedule and scope configured by the organization administrator in Metadata Command Center, technical assets appear in Data Governance and Catalog.

When the organization administrator configures a scan schedule in Metadata Command Center, you might find a large number of assets in Data Governance and Catalog after the first scan. For subsequent scans, incremental assets are sent to Data Governance and Catalog.

For more information about importing technical assets, see *Metadata Command Center* in the Metadata Command Center help.

Import business assets

If you need to upload a large number of business assets to Data Governance and Catalog or if you want to assign business context to a large number of technical assets, you can enter the values in a Microsoft Excel file and upload the file to Data Governance and Catalog.

Note: To import business assets, the organization administrator must provide you the Data Governance and Catalog **Import** privilege. For more information about the available features that the organization administrator can enable, see the *Manage access to assets* topic in the *Asset Management* help.

For more information about bulk uploading assets, see the *Bulk Import* help.

Notifications

You receive notifications in IDMC for certain events, including job status updates, license expiration, and workflow progress. You can manage how you receive notifications.

The Notifications icon on the toolbar displays the number of unread notifications. You can click the icon to view the latest unread notifications in the notifications tray. In some services, you can filter the tray to display only notifications from the current service.

You can also view and manage notifications on the **Notifications** page. To access the **Notifications** page, select **View All Unread** from the Actions menu in the notifications tray. On the **Notifications** page, you can filter notifications by service, category, subcategory, status, and date received.

Editing your user profile

Your user profile contains the details of your IDMC user account.

You can update the following information in your profile:

- First and last name
- Job title
- Email address
- Phone number
- Time zone (used in the job execution time stamps on the **All Jobs**, **Running Jobs**, **My Jobs**, **Import/Export Logs**, and **My Import/Export Logs** pages)
- Password
- Security question and answer

Note: If you use SAML to log in to IDMC and your organization administrator has enabled SAML group and role mapping on the **SAML Setup** page in Administrator, you can update the time zone attribute. Your enterprise directory updates the other attributes directly each time you log in to IDMC.

1. Click the **User** icon in the top right corner of the IDMC window and then select **Profile**.
2. On the **Profile** page, add or edit personal information such as your name, job title, phone number, and time zone.
3. To update your email address, click **Update Email**.

   IDMC sends a verification email to your new email address. The email contains a link that is valid for 24 hours. When you click the link in the email, IDMC verifies the new address, and it appears in your profile. If the link expires, you can resend the verification email.
4. Optionally, change your password or security question.
5. Click **Save**.

Editing your user settings

In your user settings, you can configure personal preferences, including how you receive email notifications and your source control repository credentials.

To access user settings, click the **User** icon on the toolbar and then select **Settings**. The user settings page includes the following sections:

Notifications

Choose whether and how you receive email notifications.

For more information, see *User Administration* in the Administrator help.

Source Control Access

Configure repository credentials that allow you to work with source-controlled objects.

For more information, see *Organization Administration* in the Administrator help.

Note: Depending on which service you are in, the user settings page might appear different and show different names for the sections.

CHAPTER 3

Informatica resources

In addition to the online help, you can find information about Intelligent Data Management Cloud™ (IDMC) using the following resources.

IDMC web site

You can access the Informatica® Intelligent Data Management Cloud™ (IDMC) web site at http://www.informatica.com/cloud.

IDMC Communities

Use the IDMC Community to discuss and resolve technical issues. You can also find technical tips, documentation updates, and answers to frequently asked questions.

Access the IDMC Community at:

https://network.informatica.com/community/informatica-network/products/cloud-integration

Developers can learn more and share tips at the Cloud Developer community:

https://network.informatica.com/community/informatica-network/products/cloud-integration/cloud-developers

IDMC Marketplace

Visit the Informatica Marketplace to try and buy Data Integration Connectors, templates, and mapplets:

https://marketplace.informatica.com/

IDMC Trust Center

The IDMC Trust Center provides information about Informatica security, compliance, and privacy practices.

You can access the trust center at https://trust.informatica.com/.

IDMC Pulse Dashboard

The IDMC Pulse Dashboard provides system status and upgrade information for all PODs and services across IDMC.

Follow the services you use and subscribe to alerts to receive notifications about upgrades, maintenance, production incidents, and upcoming releases. The IDMC Pulse Dashboard displays the production status of all the IDMC products. All maintenance updates are posted to this page, and during an outage, it will have the most current information. To ensure you are notified of updates and outages, you can subscribe to receive updates for a single service or all IDMC services. Subscribing to all services is the best way to be certain you never miss an update.

For more information, see the Service Status and Communications guide.

Informatica Product Availability Matrices

Product Availability Matrices (PAMs) indicate the versions of the operating systems, databases, and types of data sources and targets that a product release supports. You can browse the Informatica PAMs at https://network.informatica.com/community/informatica-network/product-availability-matrices.

Informatica Documentation

Use the Informatica Documentation Portal to explore an extensive library of documentation for current and recent product releases. To explore the Documentation Portal, visit https://docs.informatica.com.

If you have questions, comments, or ideas about the product documentation, contact the Informatica Documentation team at infa_documentation@informatica.com.

Informatica Knowledge Base

Use the Informatica Knowledge Base to find product resources such as how-to articles, best practices, video tutorials, and answers to frequently asked questions.

To search the Knowledge Base, visit https://search.informatica.com. If you have questions, comments, or ideas about the Knowledge Base, contact the Informatica Knowledge Base team at KB_Feedback@informatica.com.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the IDMC Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.
