Overview

To configure the Azure key vault on the Azure portal, you first need to register the app service and then configure the key vault.

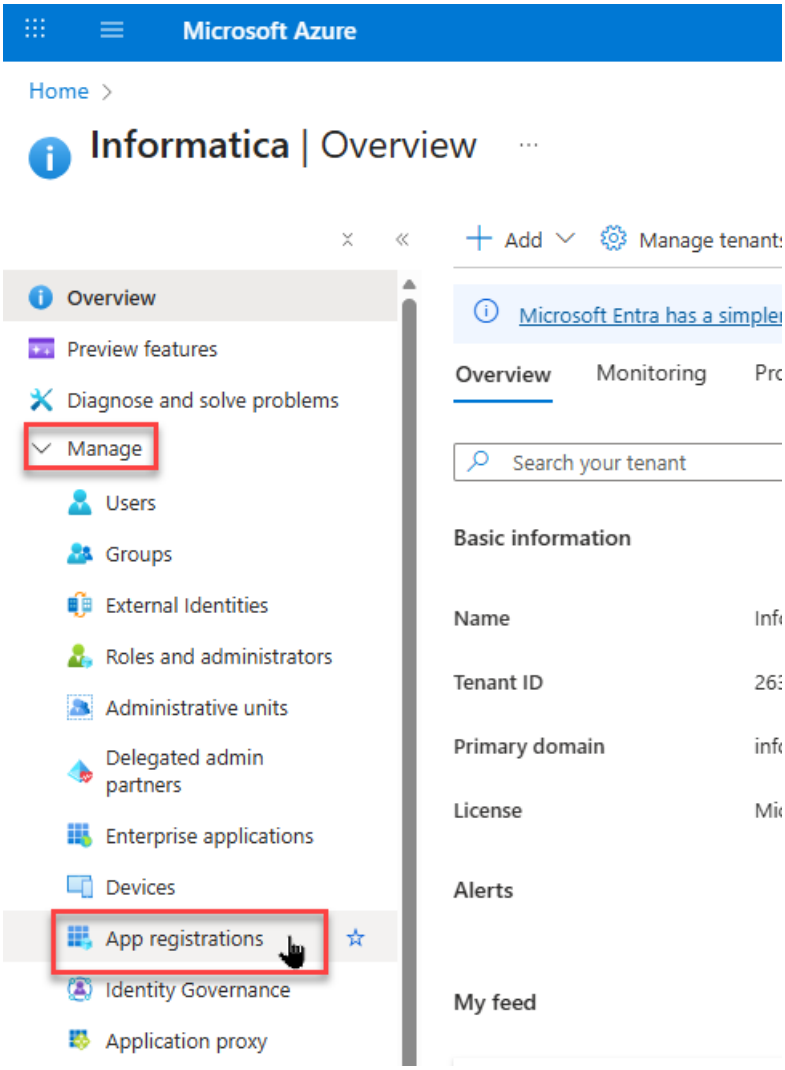

Once the key vault is configure on the Azure portal, you can select it as a secrets manager in Informatica Intelligent Cloud Services.

Registering the Azure App Service

Register the Azure App Service on the Azure portal. Skip this step if you've already registered the Azure App Service at your organization.

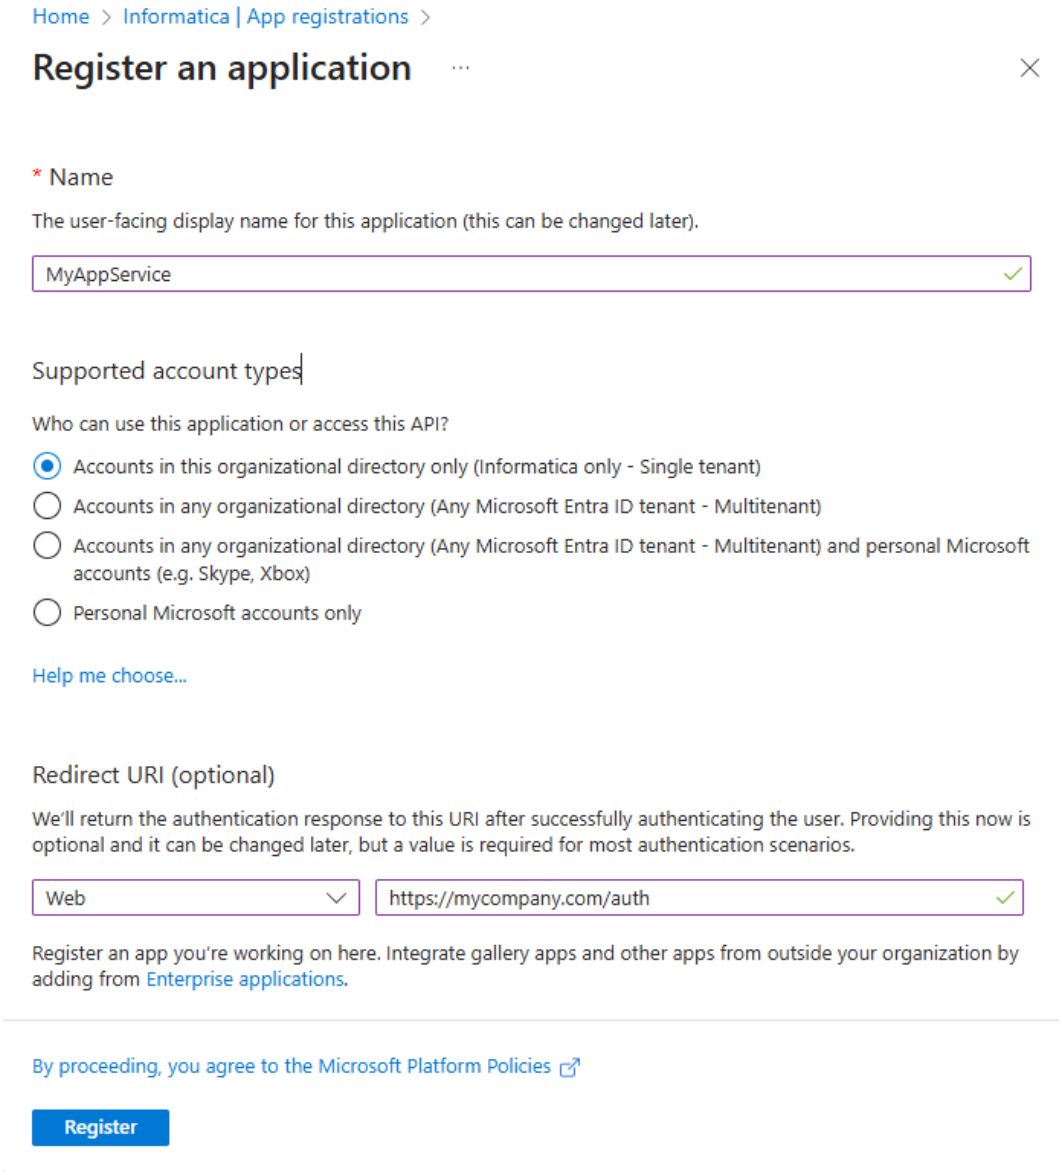

1. Sign on to the Azure portal.
2. Select **Microsoft Entra ID** from the side panel or search for it.

3. In the **Manage** section, select **App registrations**.

4. Click **New registration**.
5. Enter a name for your application.
6. Under **Supported account types**, select the type of accounts that can use this app or access the API.
7. For the **Redirect URI**, select **Web** and enter the URL to where the application will be redirected.

The following image shows an example of a new registration:

8. Click **Register**.

Configuring Azure key vault on the Azure portal

You can configure the Azure key vault after you've registered the Azure App Service.

1. Log in to the Azure portal.
2. Select **Key vaults** from the list of Azure services and then click **+Create**.
3. On the **Basics** tab, enter your key vault details.
4. On the **Access configuration** tab, select your preferred option under **Permission model**:
   - **Azure role-based access control**. This method provides fine-grained access management to Azure resources and is the recommended method.

- **Vault access policy**. This method determines whether a given security principal, namely a user, application, or user group, can perform different operations on key vault secrets, keys, and certificates. For improved security, use the role-based access control method instead.
  When using a vault access policy, create a new policy with the following permissions under the **Secret permissions** category:

  Get

  List

  Set

  Delete

  Recover

  Backup

  Restore

  The following image shows where to set the permissions:

5. On the **Networking** tab, select **Enable public access** and **All networks**.
6. On the **Tags** tab, optionally define tags.
7. Click **Create**.
8. When your key vault is created, click **Go to resource**.

   Your key vault details are shown.

9. Complete either of the following procedures, based on the permission model configured in the key vault:
   - If you chose the **Azure role-based access control** permission model, add the Azure App and user who manages secrets to the built-in **Key Vault Administrator** role.
   - If you chose the **Vault access policy** permission model, assign the access policy that you created earlier to the Azure App and to users who need to create and manage secrets.

   For more information on how to complete these procedures, refer to the Azure documentation.
10. Add the Azure key vault as the secret vault to Informatica Intelligent Cloud Services.

    For more information, see the following topics in the Informatica Intelligent Cloud Services *Organization Administration* guide:
    - Secrets Manager
    - Azure Key Vault configuration
