Preface

Read *What's New* to learn about new features in IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC) for the October 2026 release.

Informatica Resources

Informatica provides you with a range of product resources through the Informatica Network and other online portals. Use the resources to get the most from your Informatica products and solutions and to learn from other Informatica users and subject matter experts.

Informatica Documentation

Use the Informatica Documentation Portal to explore an extensive library of documentation for current and recent product releases. To explore the Documentation Portal, visit https://docs.informatica.com.

If you have questions, comments, or ideas about the product documentation, contact the Informatica Documentation team at infa_documentation@informatica.com.

IDMC web site

You can access the Informatica® Intelligent Data Management Cloud™ (IDMC) web site at http://www.informatica.com/cloud.

IDMC Communities

Use the IDMC Community to discuss and resolve technical issues. You can also find technical tips, documentation updates, and answers to frequently asked questions.

Access the IDMC Community at:

https://network.informatica.com/community/informatica-network/products/cloud-integration

Developers can learn more and share tips at the Cloud Developer community:

https://network.informatica.com/community/informatica-network/products/cloud-integration/cloud-developers

IDMC Marketplace

Visit the Informatica Marketplace to try and buy Data Integration Connectors, templates, and mapplets:

https://marketplace.informatica.com/

Data Integration connector documentation

You can access documentation for Data Integration Connectors at the Documentation Portal. To explore the Documentation Portal, visit https://docs.informatica.com.

Informatica Knowledge Base

Use the Informatica Knowledge Base to find product resources such as how-to articles, best practices, video tutorials, and answers to frequently asked questions.

To search the Knowledge Base, visit https://search.informatica.com. If you have questions, comments, or ideas about the Knowledge Base, contact the Informatica Knowledge Base team at KB_Feedback@informatica.com.

IDMC Trust Center

The IDMC Trust Center provides information about Informatica security, compliance, and privacy practices.

You can access the trust center at https://trust.informatica.com/.

IDMC Pulse Dashboard

The IDMC Pulse Dashboard provides system status and upgrade information for all PODs and services across IDMC.

Follow the services you use and subscribe to alerts to receive notifications about upgrades, maintenance, production incidents, and upcoming releases. The IDMC Pulse Dashboard displays the production status of all the IDMC products. All maintenance updates are posted to this page, and during an outage, it will have the most current information. To ensure you are notified of updates and outages, you can subscribe to receive updates for a single service or all IDMC services. Subscribing to all services is the best way to be certain you never miss an update.

For more information, see the Service Status and Communications guide.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the IDMC Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.

CHAPTER 1

October 2026

The following topics provide information about the new features, enhancements, and changed behavior in the October 2026 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Changelog October 2026

Read the changelog to learn about significant changes to this publication for this release.

The following table describes changes in this publication:

Publication Date	Type of Change	Section Title
October 15, 2026	Added	"IPU metering for short-running sessions" on page 11
September 30, 2026	Added	#unique_17/unique_17_Connect_42_GUID-11E53A09-36FB-4619-B353-4EDD3C8560A9on page 11
September 10, 2026	Initial publication	

Important notices and upcoming changes

The October 2026 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following important notices and upcoming changes.

CDI-PC update strategy

Effective in the October 2026 release, CDI-PC moves to a mode of update with a mandatory April update and an optional October update. Previously, both the April and October updates were mandatory.

The April update remains mandatory and includes a 90-day update window. The October update is optional. You can skip the October update and roll forward to the next April update, which includes all the updates from the earlier October update.

For example, if you apply the April 2026 update and want to avoid updating CDI-PC towards the end of the year, you can skip the October 2026 update and choose the April 2027 update as necessary. The April 2027 update includes all the October 2026 updates.

Apply the October 2026 update only if you need specific PAM fixes or critical security patches from that release. Otherwise, you can choose to update in April 2027.

Informatica maintains both the April and October updates. This model gives you more flexibility while keeping the release schedule predictable and supportable.

For more information about the types of CDI-PC updates, see https://docs.informatica.com/integration-cloud/cloud-data-integration-for-powercenter/h2l/1839-release-readiness/landing-page.html.

Previews lifted

This section describes the features that are no longer in preview and are production ready effective in the October 2026 release.

Data Engineering Integration (Modernization) and Data Quality (Modernization)

Effective in the October 2026 release, the Data Engineering Integration (Modernization) and Data Quality (Modernization) alongwith the following products and services are production ready:

- Developer Tool
- Analyst Tool
- Analyst Service
- Data Integration Service
- Content Management Service
- Metadata Access Service
- Model Repository Service
- Monitoring Model Repository Service
- Search Service

Previously, these products and services were only available in preview.

Installation and migration of Data Engineering Integration (Modernization) and Data Quality (Modernization)

Effective in the October 2026 release, installation and migration of Data Engineering Integration (Modernization) and Data Quality (Modernization) are production ready. Previously, this functionality was only available in preview.

You can now use the CDI-PC installer to install CDI-PC and the following products:

- Data Engineering Integration (Modernization) on a Windows or Linux machine
- Informatica Data Quality (Modernization) on a Windows, Linux, or AIX machine

You can also use the same installer to migrate existing on-premises Data Engineering Integration and Informatica Data Quality services to the cloud.

On a Linux machine, you need to create a cluster configuration to connect to a non-native environment.

For more information, see *Installation Guide for Data Engineering Integration (Modernization)* and *Installation Guide for Informatica Data Quality (Modernization)*.

Installation of third-party distribution packages

Effective in the October 2026 release, Hadoop package installation is production ready. Previously, this functionality was only available in preview.

You can use third-party distribution packages to integrate a CDI-PC domain with the Hadoop environment.

The CDI-PC domain and client require the distribution packages for the following purposes:

- Process complex files within the CDI-PC domain
- Connect to the Hadoop environment when you process within the CDI-PC domain
- Push processing to the Hadoop environment

For more information about the supported distribution packages, see the Product Availability Matrix (PAM) for Informatica Intelligent Cloud Services.

You can use the CDI-PC installer to install a distribution package. Alternatively, you can install it using Integration Package Manager (the package manager). You can download the installers for all CDI-PC components and Hadoop packages from the CDI-PC home page.

For more information, see the *Installation Guide for Data Engineering Integration (Modernization)*.

DataProc and MapR for cluster configuration

Effective in the October 2026 release, the DataProc and MapR distribution packages are production ready. Previously, these distribution packages were only available in preview.

You can select the DataProc or MapR distribution package on the CDI-PC domain and Client when you configure a cluster for integration with Hadoop environments.

Note: DataProc and MapR support applies only to Data Engineering Integration modernization in the native environment.

For more information, see the *Installation Guide for Data Engineering Integration (Modernization)*.

PowerCenter Modernization

Re-pointing support for Data Engineering Integration sources

Effective in the October 2026 release, you can repoint the following source and target connections when you convert Data Engineering Integration mappings:

- Hive to Amazon S3
- Hive to Amazon Redshift
- HDFS to Amazon Redshift
- HDFS to Amazon S3

Non-repointing conversion support for Microsoft Azure Synapse

Effective in the October 2026 release, you can convert Data Engineering Integration mappings that use Azure Synapse as the source or target. When a converted mapping uses the Partition Type or Target Schema Strategy properties, the assessment report flags them as partially converted.

Bulk update support for Hadoop Files V2 connections

Effective in the October 2026 release, you can use the bulk update connection template to create and update Hadoop Files V2 connections.

New features and enhancements

The October 2026 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following new features and enhancements.

Manual update of a CDI-PC domain

You can update a CDI-PC domain manually by running installer commands instead of updating through IDMC. Manual updates are useful in customer-managed environments where you don't want to update the domain through IDMC .

You can update the domain from your current version to the next version. Before you update, shut down the domain completely and verify that no processes are running. Run the update commands from the directory that contains the extracted binaries.

For more information, see the *Domain Updates* help.

Automatic detection of the product during installation

When you run the CDI-PC installer, you don't need to select a product. The installer automatically detects the product to install based on your license key. The installer reads the license to identify CDI-PC, Data Engineering Integration (Modernization), or Informatica Data Quality (Modernization) and installs the required components and configures the required services.

The Hadoop options apply only to a Data Engineering Integration (Modernization) license.

For more information, see the *CDI-PC Installation Guide*.

Conversion of nested Data Engineering Integration mapplets

You can convert the following Data Engineering Integration mappings and mapplets to Cloud Data Integration:

- Mappings and mapplets that contain nested mapplets
- Mapplets that reference other mapplets

Each mapplet in the hierarchy converts as its own reusable object, so that the parent-child mapplet structure is preserved instead of flattening it into a single mapplet.

For more information, see *PowerCenter Modernization*.

Conversion of Data Engineering Integration dynamic mappings

You can convert Data Engineering Integration mappings that use dynamic ports to Cloud Data Integration. When you convert dynamic mappings, the Data Engineering Integration source and target definitions, port selector rules, dynamic expressions, and wildcard column configurations are converted to their equivalent assets of Cloud Data Integration. After conversion, the parameterized and runtime-resolution behavior are preserved in the converted CDI mappings.

The conversion report identifies dynamic mapping constructs that require manual review or that were partially converted.

For more information, see *PowerCenter Modernization*.

Conversion of PowerCenter XML sources and XML parser transformations

You can convert PowerCenter mappings that contain an XML source or XML Parser transformation. XML sources are converted to a fixed-width flat file source with a downstream structure parser transformation. The flat file uses a single column to hold the XML content with line sequential option enabled. XML Parser transformations are converted to structure parser transformations in Cloud Data Integration.

CDI-PC fully supports normalized (hierarchy) and entity-relationship parser types. For unsupported parser types, the converter generates a normalized structure definition and logs a warning. The resulting mapping might be invalid and require manual correction.

For more information, see *PowerCenter Modernization*.

Conversion of VSAM sources with a normalizer source qualifier

You can now convert PowerCenter mappings that use a VSAM source with a normalizer source qualifier. The converter replaces the VSAM source and normalizer with a flat file source. After conversion, create a Structure Parser transformation with the COBOL copybook definition and replace the flat file source with the Structure Parser transformation.

For more information, see *PowerCenter Modernization*.

Bulk update script information of command tasks

When you run a bulk update task for taskflows, you can now update the script information of command tasks.

For more information, see *PowerCenter Modernization*.

Changed behavior

Cloud Data Integration for PowerCenter (CDI-PC) includes the following changed behaviors in the October 2026 release.

IPU metering for short-running sessions

CDI-PC meters sessions that run for less than eight seconds based on the elapsed session runtime. After you update your domain to October 2026, you might see an increase in IPU consumption because metering now includes short-running workflows.

Previously, CDI-PC did not meter sessions that ran for less than eight seconds.

For more information, see *Metering* in the *Organization Administration* help.

Flat file target port ordering during conversion

When you convert a PowerCenter mapping with a non-parameterized flat file target set to create the file at runtime, the converted mapping now uses the native field-ordering target property of Cloud Data Integration to match the original PowerCenter column order.

Previously, the converter inserted an extra Expression transformation before the target to reorder the fields.

For more information, see *PowerCenter Modernization*.

Skip rounding decimal and double data types for converted flat file targets

When you convert a PowerCenter mapping that creates a flat file target at run time, by default CDI-PC selects the **Skip rounding decimal and double data types** option to preserve numeric precision from the original mapping.

Schema and table name retention during conversion

In Oracle, Microsoft SQL Server, and ODBC connections, when a source or target has the schema name or table name overridden at the session level, the converter now retains the overridden schema name and table name into the mapping task instead of parameterizing the source or target. This behavior applies when you set `OverrideOwnerNameSessionAttribute=false` and `OverrideTableNameSessionAttribute=false`. After

conversion, the retained schema name and table name appear under Advanced Properties of the mapping task.

Previously, when you used these flags, the converter created non-parameterized objects but ignored the schema name and table name from the session.

For more information, see *PowerCenter Modernization*.

Default value of HandleLKPOutputPortDefaultValue property

The default value of the `HandleLKPOutputPortDefaultValue` conversion property is now set to `true` since the property applies only to cloud data warehouse lookups.

Previously, the default value was `false` and the migration team had to set the property manually for cloud data warehouse repointing tasks.

For more information, see *PowerCenter Modernization*.

Schema and table name retention during conversion

When you convert mappings that contain a flat file target configured as Create New at Runtime, the converter now enables the **Skip Rounding for decimal and double datatypes** property on the target by default.

Previously, the converter did not set this property automatically.

For more information, see *PowerCenter Modernization*.

Default value handling for Snowflake and BigQuery lookups

When you convert a PowerCenter mapping with a connected lookup transformation on a Snowflake or Google BigQuery connection that has a default value on the return field, the converted mapping now sets the default value directly in the lookup return field metadata and enables the **Use Lookup Field Default Value** property.

Previously, the converter added an extra expression transformation after the lookup transformation to substitute the default value when the lookup returned null.

For more information, see *PowerCenter Modernization*.

CHAPTER 2

April 2026

The following topics provide information about the new features, enhancements, and changed behavior in the April 2026 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Changelog April 2026

Read the changelog to learn about significant changes to this publication for this release.

The following table describes changes in this publication:

Publication Date	Type of Change	Section Title
April 11, 2026	Added	"Conversion of session parameters to mapping variables" on page 18
April 11, 2026	Added	"Conversion support for dynamic mappings" on page 17
April 11, 2026	Updated	"New Data Engineering Integration connectors and transformations support" on page 15
April 11, 2026	Added	"Re-pointing support for Stored Procedure transformation" on page 15
April 11, 2026	Added	"Re-pointing support for SQL transformation" on page 15
April 2, 2026	Added	"Connection details in the assessment report" on page 17
April 2, 2026	Added	"Bulk update connections template" on page 17
April 2, 2026	Added	"Override schema properties for non-repointing conversion" on page 17
April 2, 2026	Added	"New Data Engineering Integration connectors and transformations support" on page 15

Publication Date	Type of Change	Section Title
April 2, 2026	Added	"PowerCenter re-pointing support" on page 14
March 11, 2026	Initial publication	

Important notices

The April 2026 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following important notices.

Azul JDK 17

Effective in April 2026, CDI-PC uses version 17 of the Azul Java Development Kit.

Before you migrate or update to a CDI-PC version that includes a new Java version (for example, moving from Java 11 to Java 17), you must validate all your custom Java code, dependencies, and external JARs, especially those referenced in Java transformations.

See the Product Availability Matrix for Cloud Data Integration for PowerCenter (CDI-PC) corresponding to your current version to identify the exact JDK version that will be replaced by JDK 17.

Update information

The April 2026 update to Cloud Data Integration for PowerCenter (CDI-PC) is a mandatory update and must be applied within 90 days of release. Domains that you don't update within 90 days are marked as obsolete and the domain status appears offline in IDMC. You can't run jobs or perform tasks on obsolete domains.

You can apply the update on CDI-PC domains of the October 2025 version. Although a domain shuts down during the update, you do not need to perform any manual task. The update performs all the tasks including binary download, shutdown of the domain before the update, and restart of services after the update.

For more information about how to apply updates, see *Domain Updates*.

For more information about the types of CDI-PC updates, see https://docs.informatica.com/integration-cloud/cloud-data-integration-for-powercenter/h2l/1839-release-readiness/landing-page.html.

DataProc and MapR for cluster configuration

Effective in April 2026, DataProc and MapR distribution packages are available for preview on the CDI-PC domain and Client for integration with the Hadoop environments. DataProc and MapR apply only to Data Engineering Integration modernization in the native environment.

Preview functionality is supported for evaluation purposes but is unwarranted and is not supported in production environments or any environment that you plan to push to production. Informatica intends to include the preview functionality in an upcoming release for production use, but might choose not to in accordance with changing market or technical circumstances. For more information, contact Informatica Global Customer Support.

PowerCenter re-pointing support

Effective in the April 2026 release, you can repoint PowerCenter assets from FlatFile to DB2-Loader and Databricks cloud connections.

For more information, see *PowerCenter Modernization*.

Re-pointing support for SQL transformation

Effective in the April 2026 release, you can repoint SQL transformations from Oracle, Microsoft SQL Server, ODBC, Teradata, and IBM DB2 connections to the following cloud connections using the Connection Map configuration:

- Snowflake
- Google BigQuery
- Amazon Redshift
- Databricks
- Azure Synapse

Re-pointing support for Stored Procedure transformation

Effective in the April 2026 release, you can repoint Stored Procedure transformations from Oracle, Microsoft SQL Server, ODBC, Teradata, and IBM DB2 connections to Databricks cloud connections using the Connection Map configuration.

New Data Engineering Integration connectors and transformations support

Effective in the April 2026 release, conversion support for the following Data Engineering Integration connections types and transformations is available for preview:

- Non-repointing conversion of assets from the following connection types:
  - Amazon Redshift
  - ADLS Gen2
  - Azure Synapse
- Repointing conversion of assets from Teradata to the following cloud connection types:
  - Snowflake
  - Databricks
  - Google BigQuery
- Conversion of the following transformations:
  - R2H
  - H2R

Preview functionality is supported for evaluation purposes but is unwarranted and is not supported in production environments or any environment that you plan to push to production. Informatica intends to include the preview functionality in an upcoming release for production use, but might choose not to in accordance with changing market or technical circumstances. For more information, contact Informatica Global Customer Support.

New features and enhancements

The April 2026 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following new features and enhancements.

Reprepare a domain for update

You can reprepare a domain for an update when changes, such as a mandatory EBF or a new installer version, become available after your initial preparation.

If a domain has been successfully prepared but new updates or EBFs are released, its status will automatically change to **Prepare Outdated**. This new status allows you to easily filter and identify which domain require attention. You can then review the new changes that will be applied and choose to reprepare the domain. This action updates your plan with the latest changes without initiating the full domain update, giving you the flexibility to incorporate them at your convenience before committing to the final update schedule.

For more information, see *Domain Updates*.

Domain registration during installation

You can register your CDI-PC domain during the installation process. When you run the installer to perform a new installation or migrate an existing domain, you can register the domain to establish communication between the domain and Intelligent Data Management Cloud.

For more information, see *Installation Guide*.

CDI-PC REST API

Use CDI-PC REST API resources to register, deregister, reconcile, delete, and get the status of a CDI-PC domain.

For more information, see *REST API Reference*.

Import external assessment results

You can import assessment results that are executed outside the organizational pod by uploading externally generated assessment result files to CDI-PC. By importing assessment results, you can proceed with the asset conversion processes when the in-pod assessments fail. After you import, you can view the assessment results on the repository dashboard and initiate asset conversion.

For more information, see *PowerCenter Modernization*.

Update connections in bulk

After you convert the assets of a repository, you can use the bulk update task to create and update multiple connections with one operation. You can either import the connection template `BulkUpdateConnectionTemplate.xlsx` file that is included in the assessment results ZIP, bulk upload connection metadata to Cloud Data Integration, or update existing connections using an Excel template.

For more information, see *PowerCenter Modernization*.

Complexity matrix for asset conversion

To improve the accuracy of conversion effort estimation for the assets that can be manually or partially converted, the assessment summary Excel file includes complexity score for each asset. This score reflects the difficulty level of converting an asset by evaluating multiple key factors, enabling more precise planning and prioritization. The complexity matrix includes the following details:

Complexity Scoring

Each asset receives a score based on parameters, such as the number of sessions, workflows, mappings, and dependencies, it contains. Assets are categorized into Low, Medium, or High complexity levels to provide clear insight into their conversion challenges.

Prioritized Assessment

Assets with higher complexity scores are flagged for deeper analysis and focused planning, ensuring resources are allocated effectively.

Comprehensive Factors

The matrix considers critical elements including the count and type of partial flags, concurrent workflows, target load ordering, and the presence of custom components or scripting. These factors collectively influence the overall conversion effort.

For more information, see *PowerCenter Modernization*.

Conversion support for dynamic mappings

You can convert mappings that contain dynamic sources, targets, or ports to Cloud Data Integration using a conversion task.

For more information, see *PowerCenter Modernization*.

Override schema properties for non-repointing conversion

You can override schema properties for non-repointing asset conversions. Before you convert assets, you can configure a connection map configuration with override schema properties and use the configuration in conversion tasks.

For more information, see *PowerCenter Modernization*.

Changed behavior

Cloud Data Integration for PowerCenter (CDI-PC) includes the following changed behaviors in the April 2026 release:

Bulk update connections template

After you assess a PowerCenter repository, the assessment report ZIP now contains a new file named `BulkUpdateConnectionTemplate.xlsx`. You can update and use this file in a bulk update task to create or update multiple connections with one operation.

Previously, you could update the connections only manually because the assessment report did not include the template file.

For more information, see *PowerCenter Modernization*.

Connection details in the assessment report

The assessment report now includes details of the parameterized connections and their resolved values for each transformation as an Excel file.

Previously, the assessment report included connection details without the parameterized connections and their resolved values.

For more information, see *PowerCenter Modernization*.

Conversion of session parameters to mapping variables

The parameter file conversion task automatically converts session parameters with the prefix `$` into mapping variables with prefix `$$`. However, to ensure environment stability, the following parameters are not converted:

- Any parameter starting with the `$PM` prefix.
- Any parameter containing the substrings `file` or `dir` (case-insensitive).

For more information, see *PowerCenter Modernization*.

CHAPTER 3

October 2025

The following topics provide information about the new features, enhancements, and changed behavior in the October 2025 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Important notices

The October 2025 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following important notices.

Preview initiated

Effective in the October 2025 release, the following products and services are available for preview:

- Data Engineering Integration (Modernization)
- Data Quality (Modernization)
- Developer Tool
- Analyst Tool
- Analyst Service
- Data Integration Service
- Content Management Service
- Metadata Access Service
- Model Repository Service
- Monitoring Model Repository Service
- Search Service

Preview functionality is supported for evaluation purposes but is unwarranted and is not supported in production environments or any environment that you plan to push to production. Informatica intends to include the preview functionality in an upcoming release for production use, but might choose not to in accordance with changing market or technical circumstances. For more information, contact Informatica Global Customer Support.

For more information, see the CDI-PC *Installation Guide*.

Install or migrate Data Engineering Integration (Modernization)

Effective in the October 2025 release, installation and migration of Data Engineering Integration (Modernization) are available for preview.

You can install Data Engineering Integration (Modernization) on a Windows or Linux machine. Run the CDI-PC installer to install Data Engineering Integration (Modernization) or migrate Data Engineering Integration services to Data Engineering Integration (Modernization) services.

You need to create the cluster configuration to connect to a non-native environment only on Linux.

For more information, see the CDI-PC *Installation Guide*.

Install or migrate Informatica Data Quality (Modernization)

Effective in the October 2025 release, installation and migration of Data Quality (Modernization) are available for preview.

You can install Informatica Data Quality (Modernization) on a Windows, Linux, or AIX machine. Run the CDI-PC installer to install Informatica Data Quality (Modernization) or migrate Informatica Data Quality services to Informatica Data Quality (Modernization) services.

For more information, see the CDI-PC *Installation Guide*.

Install third-party distribution package

You can use third-party distribution packages to integrate the CDI-PC domain with the Hadoop environment.

Effective in the October 2025 release, Hadoop package installation is available for preview.

The CDI-PC domain and client require the distribution packages to process complex files within the CDI-PC domain, to connect to Hadoop environment when you process within the CDI-PC domain, or to push processing to Hadoop environment. When you push processing to the Hadoop environment, the CDI-PC domain and client require distribution packages. For more information about the supported distribution packages, see the Product Availability Matrix (PAM) for Informatica Intelligent Cloud Services.

You can use the CDI-PC installer to install a distribution package. Alternatively, you can install it using Integration Package Manager (the package manager). You can download the installers for all CDI-PC components and Hadoop packages from the CDI-PC home page.

For more information, see the CDI-PC *Installation Guide*.

Update information

The October 2025 update to Cloud Data Integration for PowerCenter (CDI-PC) is a mandatory update and must be applied within 90 days of release. Domains that you don't update within 90 days are marked as obsolete and the domain status appears offline in IDMC. You can't run jobs or perform tasks on obsolete domains.

You can apply the update on CDI-PC domains of the April 2025 version. Although a domain shuts down during the update, you do not need to perform any manual task. The update performs all the tasks including binary download, shutdown of the domain before the update, and restart of services after the update.

For more information about how to apply updates, see *Domain Updates*.

For more information about the types of CDI-PC updates, see https://docs.informatica.com/integration-cloud/cloud-data-integration-for-powercenter/h2l/1839-release-readiness/landing-page.html.

New features and enhancements

The October 2025 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following new features and enhancements.

Convert non-native Data Engineering Integration assets to Data Integration

You can assess Model repositories to evaluate the feasibility of converting Data Engineering Integration assets that run on a non-native environment to the cloud environment. Additionally, you can convert these assets into Data Integration assets and bulk-update the metadata of the converted assets to ensure they function seamlessly in the cloud environment.

For more information, see *PowerCenter Modernization*.

Convert Data Engineering Integration workflow assets

In addition to mapping assets, you can now convert Data Engineering Integration workflow assets to the cloud. After you assess a Model repository and run conversion tasks, you can monitor the conversion status of the workflow assets on the repository dashboard.

Integrate CDI-PC domain with Hadoop environment

You can integrate a CDI-PC domain with Hadoop clusters using Data Engineering Integration. Download the installers and the Hadoop packages from the CDI-PC service homevpage and copy the Hadoop packages to the server installer's source directory. When you run the CDI-PC installer to install Data Engineering Integration (Modernization), the Data Integration Service automatically installs Hadoop binaries to connect the CDI-PC domain with the Hadoop environment. You can import the cluster configuration into the domain, create a Hadoop connection, and set up other connections to run mappings within the Hadoop environment.

For more information, see the CDI-PC *Installation Guide*.

Repoint Data Engineering Integration assets

You can now create Repoint configurations and use them in Model repository assessment tasks. The repoint configurations enables you to evaluate the feasibility of repointing Data Engineering Integration assets to different endpoints on the cloud.

You can create Connection Map configurations and use them in Workflow Conversion tasks to convert and repoint Data Engineering Integration assets to different endpoints on the cloud.

Changed behavior

Cloud Data Integration for PowerCenter (CDI-PC) includes the following changed behavior in the October 2025 release:

CDI-PC domain update in two steps

You can now update your CDI-PC domain through two distinct update modes available on the CDI-PC service page. You can choose to update your domain in two steps by preparing for the update in advance. This **Two-step Update** ensures that your domain remains functional even if the preparation encounters an issue. The update status clearly indicates the stages of preparation and final update that allows you to complete preparation several days prior to your scheduled maintenance window. Alternatively, you can use the **One-step Update** mode, wherein preparation and update occur simultaneously with a single action.

Previously, the domain update was a single-step process and did not offer the benefits of preparing in advance.

Enhanced support for heterogeneous nodes in CDI-PC

CDI-PC now enables heterogeneous node deployments that allows you to mix Windows, Linux, and AIX nodes within the same domain. You can deploy and operate Windows, Linux, and AIX nodes together seamlessly in a single CDI-PC domain. Additionally, you can deploy Secure Agents on either Windows, Linux, or AIX enabling them to communicate with domains running on different operating system platforms as needed.

Previously, the CDI-PC domain and the Secure Agent were required to be on the same operating system. For example, you couldn't establish communication between a domain installed on Linux and a Secure Agent installed on Windows.

Repoint and Connection Map configurations

You can now select the type of repository, such as Model and PowerCenter, to create Repoint and Connection Map configurations using the new **Repository Type** field.

Previously, the Repoint and Connection Map configurations were created only for PowerCenter repository by default.

For more information, see *PowerCenter Modernization*.

CHAPTER 4

July 2025

The following topic provides information about the new features and changed behavior in the July 2025 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Important notices

The July 2025 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following important notice.

Cloud-only release

The July 2025 release of CDI-PC is a cloud-only update. This cloud-only update doesn't impact the CDI-PC domain or its on-premises application services.

Additionally, the Domain Management App that the Secure Agent uses to connect the on-premises domains with Informatica Cloud is automatically updated and you do not need to take any action.

For more information about the types of CDI-PC updates, see https://docs.informatica.com/integration-cloud/cloud-data-integration-for-powercenter/h2l/1839-release-readiness/landing-page.html.

New features and enhancements

The July 2025 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following new feature.

Conversion of Data Engineering Integration assets to Data Integration

You can assess Model repositories to evaluate the feasibility of converting Data Engineering Integration assets that run on a native environment to the cloud environment. Additionally, you can convert these Data Engineering Integration assets into Data Integration assets and bulk-update the metadata of the converted assets to ensure they function seamlessly in the cloud environment.

For more information, see *PowerCenter Modernization*.

Changed behavior

Cloud Data Integration for PowerCenter (CDI-PC) includes the following changed behavior in this release:

Single-page repository dashboard

After you assess a PowerCenter or Model repository, you can use the repository dashboard for a centralized view of the asset migration to Data Integration. You can now view the assessment results, conversion status, and connection details of the assets on a single page for easy access and analysis.

Previously, the dashboard was available only for PowerCenter repositories, and you could view assessment, conversion, and repoint connection details across separate tabs.

For more information, see *PowerCenter Modernization*.

Assessment and conversion tasks

- Assessment and conversion tasks now support a new repository type, Model Repository.
- In the Data Engineering Integration platform, assessment currently applies to non-repointing migration only.
- The assessment task for Model repositories assesses the conversion feasibility to Data Integration only.
- For Data Engineering Integration assets, CDI-PC supports the conversion of mapping assets only.

CHAPTER 5

April 2025

The following topic provides information about the new features in the April 2025 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Important notices

The April 2025 release of Cloud Data Integration for PowerCenter (CDI-PC) include the following important notices.

Previews lifted

Effective in the April 2025 release, Informatica Developer (the Developer Tool) and the following application services are production-ready. Previously, this functionality was only available in preview.

- Data Integration Service
- Model Repository Service
- Monitoring Model Repository Service

Note: The Data Integration Service, the Model Repository Service, and the monitoring Model Repository Service apply only to Data Engineering Integration modernization and Informatica Data Quality modernization in the native environment.

For more information, see the CDI-PC *Administrator Guide*.

Emergency Bug Fixes (EBF) and patches

You can apply Emergency Bug Fixes (EBFs) on Windows, Linux, and AIX machines using the CDI-PC installer or from the CDI-PC service page. When you run the CDI-PC installer to create, join, migrate, or update a domain, or update an obsolete domain, the installer applies all the default EBFs. You can find the list of EBF files in the `<CDI-PC_Installer_Location>/source/EBF/` folder.

If you want to apply additional EBFs, you can copy the EBFs to the EBF source location and run the CDI-PC installer.

For more information about applying an EBF using the installer, see the CDI-PC *Installation Guide*.

For more information about applying and managing an EBF from the CDI-PC service page, see *Domain Updates*.

New features and enhancements

The April 2025 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following new features and enhancements.

Manage Emergency Bug Fixes (EBFs) and patches

You can now apply EBFs and patches to a CDI-PC domain from the **Domain Details** page. You can view the details of all the EBFs and patches available for a domain and its nodes on a single page. You can also view all the EBFs that are applied to the domain.

For more information, see *Domain Updates*.

Domain Management App port assignment

You can customize the Secure Agent port range for enhanced communication between the Domain Management App (DMA) and a CDI-PC domain. Configure the port range using the `DMA_DOMAIN_COMM_PORT_MIN` and `DMA_DOMAIN_COMM_PORT_MAX` properties in Administrator. The default port ranges between 14000 and 14999.

Ensure that the port range is white listed on the virtual machine to enable communication between the CDI-PC domain and DMA to prevent the domains from going into the offline mode.

For more information, see *Administrator*.

Repository dashboard

After you assess a PowerCenter repository, you can use the repository dashboard for a centralized view of the migration to Cloud Data Integration (CDI). You can analyze the assessment results and conversion status of the repository in a graphical format. You can also analyze the details of supported and unsupported repoint connections of the repository in a tabular format. For example, you can find answers to the following questions using the dashboard:

- How many mapping assets in a specific folder can be automatically converted?
- What are the top five flags causing manual conversion of workflow assets?
- How many assets in a folder are not converted yet?
- How many connections for Snowflake include SQL transformations?

For more information, see *PowerCenter Modernization*.

Manual and partial flag details for assets

In an assessed repository, for workflows that require manual or partial conversion, you can view the assessment results to understand the reasons behind the manual or partial conversion status. The result provides a list of assets within the workflow and the flags for each asset responsible for the manual or partial conversion. The flag details also include recommended actions that you need to take before you can migrate the assets.

For more information, see *PowerCenter Modernization*.

Bulk update mapping tasks

You can now update the metadata for mapping task assets in bulk after you convert them to Cloud Data Integration assets. You can create bulk update tasks to update the following types of metadata:

- General properties
- Source transformation advanced properties
- Target transformation advanced properties
- Lookup transformation advanced properties

- Sequence advanced properties

For information about how to the new asset dialog box, see *PowerCenter Modernization*.

Changed behavior

Cloud Data Integration for PowerCenter (CDI-PC) includes the following changed behavior in this release:

Retention of asset conversion status

When you re-assess a PowerCenter repository, the conversion status of the converted assets does not change. The assessment result of the repository shows the conversion status of the assets as **Successful** for the converted assets. CDI-PC does not retain the conversion status of the failed conversion tasks.

Previously, re-assessing a repository would reset the status of converted assets to the **Pending** state.

For more information, see *PowerCenter Modernization*.

Retention of assessment runs during purge

When you run purging tasks to delete runtime data, CDI-PC retains the assessment details of the latest two runs.

Previously, purging the runtime data deleted the details of all previous assessment runs.

Assessment Report Files

In addition to the existing files, the assessment report ZIP now includes the following files:

- `Connection_Summary_Report.xlsx` : Contains a list of all supported and unsupported connections available in the repository.
- `MANUAL_FLAGS.csv`: Contains a list of all manual flags and the number of assets impacted by the flags in the repository.
- `PARTIAL_FLAGS.csv`: Contains a list of all partial flags and the number of assets impacted by the flags in the repository.

In addition to the existing sheets, the assessment report Excel file now includes the following sheets:

- Connection_Summary: Contains the repoint configuration details and the list of connections used in the assessed repository with their count.
- Sessions: Contains the list of workflow and worklet sessions in the repository. This sheet also contains the list of flags responsible for manual or partial conversion of the workflow and worklet sessions.

The following sheets have been removed from the assessment report Excel file: Connections, Connection Repoint, Workflow Sessions, Worklet Sessions, and Transformations.

Update

The following topics provide information about the tasks that you must perform before you update a CDI-PC domain to 202504.

Mandatory update information

The April 2025 update to Cloud Data Integration for PowerCenter (CDI-PC) is a mandatory update. Mandatory updates must be applied by the due date. Domains that you don't update by the due date are marked obsolete.

Note: CDI-PC thick client updates are not mandatory. The clients released in the previous versions of CDI-PC are compatible with CDI-PC April 2025.

For information about CDI-PC updates, see Release Readiness.

Install language fonts for Linux

Effective in April 2025, CDI-PC uses version 11 of the Azul Java Development Kit. Azul's Zulu JDK doesn't include any font files by default, but uses the available fonts provided by the operating system as high quality TTF files. To verify the fonts installed in the Linux machines, run the `fc-match` and `fc-list` commands.

Before you update a domain, make sure that the language fonts are installed in the Linux machine that hosts the domain node. Download and install the language fonts at the root level using the `sudo` user credentials.

To install a specific fontconfig package, run the following command based on the Linux distribution:

- **Red Hat Enterprise Linux (RHEL) or CentOS Stream**

  ```
  sudo yum install fontconfig dejavu-sans-fonts dejavu-serif-fonts
  ```

  This command installs the `fontconfig` package and the DejaVu sans and serif font families on a Linux system using the `yum` package manager.

- **SUSE Linux Enterprise (SLES)**

  ```
  sudo zypper install dejavu-fonts fontconfig
  ```

  This command installs the DejaVu font family and the fontconfig library on a Linux system using the `zypper` package manager.

Windows operating system usually has a comprehensive set of fonts, including TTF files, that are pre-installed and readily available for use. Make sure that you do not enable the **Set as my display language** option as it will change your desktop language and might lock you out with unreadable text.

Apply mandatory EBF 202410.15 for unique private keys on CDI-PC multi-node domains

Note: You can skip this mandatory EBF if one or more of the following conditions are true:

- You do not use a multi-node domain
- You do not use unique private keys on each node's keystore file of a multi-node domain
- You have already applied EBF 202404.8 to all nodes of the domain before updating to 202410, and you have not added new nodes to the domain in version 202410
- You created or migrated a domain in version 202504 for the first time

If you have multi-node CDI-PC domains that have nodes using unique private keys in their keystore files, you must apply EBF 202410.15 to those nodes before updating the domains to version 202504. Additionally, if you have added new nodes in version 202410 to the domain using unique private keys in their keystore files, you must apply EBF 202410.15 to all nodes before you update the domains to version 202504.

For more information about applying and managing an EBF, see *Domain Updates*.

Update of CDI-PC domains running as a Windows service

When you initiate an update of a CDI-PC domain running as a Windows service, the domain starts in the process mode instead of the service mode.

Reason: In JDK 9 and later releases, the `java.endorsed.dirs` system property is no longer available. **CDI-PC April 2025** has upgraded its JDK version to 11. The **java.endorsed.dirs** JVM property is part of the registry in a Windows CDI-PC domain configured to start as a service. This specific registry entry was created while creating the domain and was not modified during the update from the CDI-PC service page (DMS).

Solution:

1. After the domain is updated successfully, use the following command to stop the Informatica CDI-PC service on the target Windows system where you want to start the domain as a Windows service.

   ```
   INFA_HOME/tomcat/bin/infaservice.bat shutdown
   ```

2. Run the following command to remove the Informatica CDI-PC service:

   ```
   INFA_HOME/tomcat/bin/infaservice.bat remove "InformaticaCDI-PC"
   ```

3. Run the following command to reinstall the Informatica CDI-PC service:

   ```
   INFA_HOME/tomcat/bin/infaservice.bat install "InformaticaCDI-PC" "Informatica CDI-PC"
   ```

CHAPTER 6

February 2025

The following topic provides information about the new features in the February 2025 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Important notices

The February 2025 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following important notice.

Cloud-only release

The February 2025 release of CDI-PC is a cloud-only update. This cloud-only update doesn't impact the CDI-PC domain or its on-premises application services.

Additionally, the Domain Management App that the Secure Agent uses to connect the on-premises domains with Informatica Cloud is automatically updated and you do not need to take any action.

For more information about the types of CDI-PC updates, see https://docs.informatica.com/integration-cloud/cloud-data-integration-for-powercenter/h2l/1839-release-readiness/landing-page.html.

Library upgrades of JDK and Spring Boot

The Secure Agent and other components of Informatica Data Management Cloud have been upgraded to new versions of JDK and Spring Boot. These upgrades have no impact on CDI-PC.

For more information, see our commitment to security in the following Knowledge Base article: Preparing for the February 2025 Major Release

CHAPTER 7

November 2024

The following topic provides information about the new features in the November 2024 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

New features and enhancements

The November 2024 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following new features and enhancements.

Bulk update metadata

After you convert and migrate the PowerCenter assets to the Cloud Data Integration repository, you can create bulk update tasks to update the metadata of multiple assets in a single operation. You can update metadata for the following asset types using bulk update tasks:

Mapping

Update the metadata of mapping assets, such as the field details, advanced properties, connection details, in-out parameters, and mapping SQL queries.

Taskflow

Update the metadata of taskflow assets, such as data, command, decision, assignment, and email tasks.

For more information, see *PowerCenter Modernization*.

Microsoft Azure private link

You can use a Microsoft Azure private virtual network (VNet) to configure a private connection between your VPC and Cloud Data Integration for PowerCenter (CDI-PC) using the Azure Private Link.

For more information about Microsoft Azure private link configuration, see the following How-To Library article:

Microsoft Azure Private Link Onboarding Guide for Informatica Intelligent Cloud Services

Identify SQL ELT patterns in PowerCenter

While performing Snowflake repointing assessments, you can analyze mapping patterns to identify SQL ELT patterns in your PowerCenter repositories and optimize the mapping execution performance.

Note: You can analyze mapping patterns on the Microsoft Azure and Amazon Web Services (AWS) PODs only.

For information, see *PowerCenter Modernization*.

Changed behavior

Cloud Data Integration for PowerCenter (CDI-PC) includes the following changed behavior in this release:

SQL query conversion

After you perform the assessment of a PowerCenter repository, the assessment report includes the SqlQueries folder that contains the SQL query conversion configuration files. The configuration files contain the SQL details retrieved from the repository assessment. You can use the configuration files to create conversion properties configuration and run a conversion task to convert the SQL queries.

Previously, the SQL query conversion configuration was available as part of the `CONVERT_SQL_QUERY` sheet in the `Xml_Pre_Processing_Configuration.xlsx` file.

For more information, see *PowerCenter Modernization*.

CHAPTER 8

October 2024

The following topic provides information about the new features in the October 2024 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Important notices

The October 2024 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following important notice.

Previews initiated

Effective in October 2024 release, Informatica Developer (the Developer Tool) and the following application services are available for preview:

- Data Integration Service
- Model Repository Service

Preview functionality is supported for evaluation purposes but is unwarranted and is not supported in production environments or any environment that you plan to push to production. Informatica intends to include the preview functionality in an upcoming release for production use, but might choose not to in accordance with changing market or technical circumstances. For more information, contact Informatica Global Customer Support.

New features and enhancements

The October 2024 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following new features and enhancements.

Install or migrate to CDI-PC on AIX machines

You can install CDI-PC on an AIX machine. Run the CDI-PC installer for AIX to create a CDI-PC domain, or join a domain if you are installing on multiple machines. You can also run the installer to migrate an Informatica domain to CDI-PC.

The installer includes the Pre-installation (i10Pi) System Check Tool that you can run to verify whether a system meets the minimum requirements for CDI-PC.

To install CDI-PC on AIX, the Secure Agent can be on Linux and the CDI-PC domain must be on AIX.

For more information, see the *Installation Guide*.

AWS private link

You can use an Amazon Virtual Private Cloud (VPC) to configure a private connection between your VPC and Cloud Data Integration for PowerCenter (CDI-PC) Service using the Amazon Web Services (AWS) Private Link.

For more information about Amazon VPC private link configuration, see the following How-To Library article:

AWS PrivateLink Onboarding Guide for Informatica Intelligent Cloud Services

New asset dialog box for CDI-PC modernization

You can use the **New Asset** dialog box on the CDI-PC home page to create assets. You can create configurations, assessment tasks, workflow conversion tasks, and parameter file conversion tasks using this dialog box.

For information about how to the new asset dialog box, see *PowerCenter Modernization*.

View all assessment and conversion tasks on the Explore page

You can view all the assessment and conversion tasks on the **Explore** page. Use the **All Tasks** option from the drop-down list on the **Explore** page and view all available tasks and assessments. You can filter the tasks based on your requirements for easy navigation.

For information about viewing all tasks, see *PowerCenter Modernization*.

Enhanced SQL query configuration file

You can use the SQL conversion configuration file in a conversion task to provide the converted SQL queries for the targeted endpoint. Use the CONVERT_SQL_QUERY sheet to fetch the SQL details from an assessment and provide the converted SQL queries for the targeted endpoint in the `Xml_Pre_Processing_Configuration.xlsx` file.

For information about viewing all tasks, see *PowerCenter Modernization*.

Enhanced usage of connection map and parameter files

You can use the connection map configurations and parameter files for non-repointing conversion tasks. You can use a connection map configuration in conversion tasks to map the PowerCenter connections to corresponding IDMC connections.

For information about viewing all tasks, see *PowerCenter Modernization*.

Changed behavior

Cloud Data Integration for PowerCenter (CDI-PC) includes the following changed behavior in this release:

Configurations for assessment and conversion

You can create and manage the repoint configuration, connection map, and conversion properties configuration on the **Configurations** tab in the **New Asset** dialog box.

Previously, you could create and manage all the configurations in the **Configurations** page.

For more information, see *PowerCenter Modernization*.

New launch point for creating assessment task, workflow conversion task, and parameter file conversion task

You can create assessment task, workflow conversion task, and parameter file conversion task from the **New Asset** dialog box.

Previously, you could create these tasks from the drop-down list in the **Explore** page.

For more information, see *PowerCenter Modernization*.

CHAPTER 9

July 2024

The following topic provides information about the new features in the July 2024 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

New features and enhancements

The July 2024 release of Cloud Data Integration for PowerCenter (CDI-PC) includes the following new features and enhancements.

Configurations for assessment and conversion

You can create the following configurations from the **Configurations** page and use them in assessment and conversion tasks:

Repoint Configuration

Contains the repoint configuration for assessment. You can use this configuration in assessment tasks to evaluate the feasibility of repointing the assets to another endpoint.

Connection Map

Contains mappings between the PowerCenter connections and the corresponding cloud connections. You can use this configuration in conversion tasks.

Conversion Properties

Contains basic and advanced conversion properties. You can use this configuration in conversion tasks to override the default conversion behavior.

PowerCenter parameter file conversion

You can convert PowerCenter parameter files to Data Integration parameter files. Create a **Parameter File Conversion Task** from the **Repositories** page, view and run the job from the **Parameter File Conversion Tasks** page, and monitor the status of the job on the **My Jobs** page.

Session-specific connection types

You can configure a new conversion property, `overrideToSessionConnectionType` to set the source or target connection type as per the session specific connection type. This flag applies to non-repointing scenarios when the source or target uses a different relational database than the session-level connection type.

Native precision and scale for repointing scenarios

You can configure a new conversion property, `UseDsqPrecisionAndScale` to set the native precision and scale for string data type as per the source qualifier. You can set this property when you repoint to any one of the following endpoints:

- Google BigQuery
- Amazon Redshift
- PostgreSQL
- Databricks
- Snowflake
- Azure Synapse

Native precision and scale for non-repointing scenarios

You can configure a new conversion property, `SrcNativeFieldsBasedOnSQFields` to set the native precision and scale for string, decimal, and date time data types based on the source qualifier. This flag applies to non-repointing scenarios for the following connections:

- Oracle
- ODBC
- Microsoft SQL Server
- Teradata
- Sybase ASE
- DB2 Loader
- Netezza

CHAPTER 10

May 2024

The following topic provides information about the new feature in the May 2024 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Important notices

Important Information for PowerExchange Users

If you are an existing CDI-PC user that uses PowerExchange and you do not have the Cloud Allowed = Y option set for your PowerExchange Listener license keys, you must update your PowerExchange Listener license keys and ensure that they have the Cloud Allowed = Y option set before you upgrade or migrate to CDI-PC 2024.04.M or later.

To obtain a license key, go the Informatica Network at https://network.informatica.com and click **Support** > **My Cases**. Then create a new case of type=Product Download & License Request to request a key that includes all current options + Cloud option.

New features and enhancements

Cloud Data Integration for PowerCenter (CDI-PC) includes the following new feature in this release:

Mandatory update reminders for major releases

When you open the Cloud Data Integration for PowerCenter (CDI-PC) service on the **My Services** page, a pop-up notification for a mandatory update appears if you have not updated the domain to the latest available major release. The notification includes details about the update and the due date to complete the update. It also includes a link to the What's New to learn more about features in the update.

The message appears each time you log in unless you choose to be reminded after 10 days. You can't disable the reminder if the update is due in 30 days or less. The pop-up continues to appear until all domains in the organization are updated.

If you are assigned a Domain Management role, you will also receive an email notification with the details of the mandatory update.

Assessment enhancement

Assessment is enhanced to reduce the number of manual assets and improve the scope of the asset conversion.

CHAPTER 11

April 2024

The following topics provide information about important notices, new features, and changed behaviors in the April 2024 release of IDMC℠ Cloud Data Integration for PowerCenter (CDI-PC).

Important notices

Update information

The April 2024 update to Cloud Data Integration for PowerCenter (CDI-PC) is a mandatory update and must be applied within 90 days of release. Domains that you don't update within 90 days are marked as obsolete and the domain status appears offline in IDMC. You can't run jobs or perform tasks on obsolete domains.

You can apply the update on CDI-PC domains of any version. Although the domain shuts down during the update, there are no manual tasks needed. The update performs all tasks including binary download, shutdown of the domain before, and restart of services after the update.

For information about how to apply updates, see *Domain Updates*.

Installation of Data Quality libraries and files

When you run the CDI-PC server installer, the installer installs the Data Quality libraries and files. You can run the Data Quality mappings that you imported from PowerCenter. However, you can't design Data Quality mappings.

For more information, CDI-PC *Repository Guide*.

Preparing for installation of PowerExchange libraries and files

At the time of the April 2024 upgrade or shortly thereafter, if you previously specified PowerExchange in the LD_LIBRARY_PATH or PATH environment variable, remove the PowerExchange references from these variables. Also, remove the PWX_HOME environment variable. The removal of these variables is required to take advantage of an April 2024 enhancement. With the enhancement, when you run the Designer or a workflow, the PowerExchange Listener version is automatically detected and the associated PowerExchange client libraries of the same version are loaded for CDI-PC.

If you previously set the LD_LIBRARY_PATH (or PATH) and PWX_HOME environment variables but did *not* set the PWX_CONFIG environment variable, copy your existing `dbmover.cfg` file to the `/usr/config/pwx` directory, which is the default configuration directory.

Alternatively, if you want to store your `dbmover.cfg` configuration file in a custom location, you can set the PWX_CONFIG environment variable or the PWX_CONFIG parameter in the `overrides.cfg` file to point to that location. For more information about this post-installation step, see the CDI-PC *Installation Guide*.

New features and enhancements

Cloud Data Integration for PowerCenter (CDI-PC) includes the following new features in this release:

Configure Kerberos authentication in a CDI-PC domain

You can configure the CDI-PC domain to use Kerberos network authentication to authenticate users and services on a network.

You can configure Kerberos authentication in a CDI-PC domain when you install the CDI-PC services, or you can configure Kerberos authentication after you install the services.

For information about configuring Kerberos authentication while creating a CDI-PC domain, see *Installation Guide*.

Resuming a failed installation

If you paused the installation to register the domain, you can resume the installation process to configure the CDI-PC Integration Service and the CDI-PC Repository Service from the installer. After domain configuration, if the installation process stops midway, you can resume the installation from the point of failure or exit.

When the service installation process fails, you can resume from the previous service configuration and recover the last entered details for that service installation.

For information about resuming the install process, see *Installation Guide*.

Alerts and notifications

You can view alerts in IDMC and receive email notifications for events and status changes of your domains.

For information about the events and status changes that generate alerts and notifications, see *Getting Started*.

IPU metering

You can view metering information for tasks that you perform in your organization and sub-organizations on the **Metering** page in Administrator.

You can view and download metering consumption data from the **Cloud Data Integration for PowerCenter** metering page. The metering page contains details including the date when the task was performed, organization details, environment details, IPU usage, and the number of IPUs consumed.

Note: Wait for at least 24 hours after the April IDMC update before you download detailed metering reports.

For information about metering, see *Organization Administration* in the Administrator help.

New update alerts for major releases

When a major update is available, a pop-up notification appears when you open the Cloud Data Integration for PowerCenter (CDI-PC) service in IDMC. The notification includes details about the update and the due date. It also includes a link to the What's New to learn more about features in the update.

The message appears 24 hours after the release becomes available. It appears each time you log in unless you choose to be reminded after 10 days. You can't choose this if the update is due in 30 days or less. The pop-up continues to appear until all domains in the organization are updated.

Delete offline domains

You can delete domains that are in the offline state. If you uninstall a domain without deregistering it, the domain appears offline on the CDI-PC Explore page. You can delete such domains from the list of domains to remove entries that you don't need.

For information about how to delete a domain, see *Domain Registration*.

Asset logs

The CDI-PC service generates logs for tasks performed on the service page. You can access the logs and log history from the Administrator service.

For information about how to view asset logs, see *Organization Administration* and *REST API Reference* in the Administrator help.

Changed behavior

Cloud Data Integration for PowerCenter (CDI-PC) includes the following changed behaviors in this release:

Edit details of domains in Update Failed state

You can edit the details of domains in the Updated Failed state.

Previously, you could not update the details of domains in the Update Failed state.

For information about how to edit domain details, see *Domain Registration*.

Domain status post update due date

When a mandatory domain update becomes available, you must apply the update by the due date. You can choose to schedule the update at an appropriate time or to manually run the update. Domains that you don't update by the due date are marked as obsolete and the domain status appears offline in IDMC. You can't run jobs or perform tasks in obsolete domains.

Previously, mandatory updates were automatically applied to domains that you don't update by the due date.

For information about domain updates, see *Domain Updates*.

Specify authentication type when you register a domain

When you register a domain on the CDI-PC Home page, you must specify whether the domain uses Kerberos or non-Kerberos authentication.

Previously, you could not register domains that use Kerberos authentication and didn't specify an authentication type during registration.

For information about how to register a domain, see *Domain Registration*.
