Index 16

Preface

Use *Microsoft Excel Connector* to learn how to read from Microsoft Excel by using Cloud Data Integration. Learn to create a connection, develop mappings, and run synchronization and mapping tasks in Cloud Data Integration.

Informatica Resources

Informatica provides you with a range of product resources through the Informatica Network and other online portals. Use the resources to get the most from your Informatica products and solutions and to learn from other Informatica users and subject matter experts.

Informatica Documentation

Use the Informatica Documentation Portal to explore an extensive library of documentation for current and recent product releases. To explore the Documentation Portal, visit https://docs.informatica.com.

If you have questions, comments, or ideas about the product documentation, contact the Informatica Documentation team at infa_documentation@informatica.com.

Informatica Intelligent Cloud Services web site

You can access the Informatica Intelligent Cloud Services web site at http://www.informatica.com/cloud. This site contains information about Informatica Cloud integration services.

Informatica Intelligent Cloud Services Communities

Use the Informatica Intelligent Cloud Services Community to discuss and resolve technical issues. You can also find technical tips, documentation updates, and answers to frequently asked questions.

Access the Informatica Intelligent Cloud Services Community at:

https://network.informatica.com/community/informatica-network/products/cloud-integration

Developers can learn more and share tips at the Cloud Developer community:

https://network.informatica.com/community/informatica-network/products/cloud-integration/cloud-developers

Informatica Intelligent Cloud Services Marketplace

Visit the Informatica Marketplace to try and buy Data Integration Connectors, templates, and mapplets:

https://marketplace.informatica.com/

Data Integration connector documentation

You can access documentation for Data Integration Connectors at the Documentation Portal. To explore the Documentation Portal, visit https://docs.informatica.com.

Informatica Knowledge Base

Use the Informatica Knowledge Base to find product resources such as how-to articles, best practices, video tutorials, and answers to frequently asked questions.

To search the Knowledge Base, visit https://search.informatica.com. If you have questions, comments, or ideas about the Knowledge Base, contact the Informatica Knowledge Base team at KB_Feedback@informatica.com.

Informatica Intelligent Cloud Services Trust Center

The Informatica Intelligent Cloud Services Trust Center provides information about Informatica security policies and real-time system availability.

You can access the trust center at https://www.informatica.com/trust-center.html.

Subscribe to the Informatica Intelligent Cloud Services Trust Center to receive upgrade, maintenance, and incident notifications. The Informatica Intelligent Cloud Services Status page displays the production status of all the Informatica cloud products. All maintenance updates are posted to this page, and during an outage, it will have the most current information. To ensure you are notified of updates and outages, you can subscribe to receive updates for a single component or all Informatica Intelligent Cloud Services components. Subscribing to all components is the best way to be certain you never miss an update.

To subscribe, on the Informatica Intelligent Cloud Services Status page, click **SUBSCRIBE TO UPDATES**. You can choose to receive notifications sent as emails, SMS text messages, webhooks, RSS feeds, or any combination of the four.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the Informatica Intelligent Cloud Services Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.

CHAPTER 1

Microsoft Excel Connector

You can use Microsoft Excel Connector to read data from a Microsoft Excel source and integrate data with other applications, databases, and flat files.

You can use Microsoft Excel source objects as sources in synchronization tasks, mappings, and mapping tasks. When you run a synchronization task or a mapping task, the Secure Agent uses the Microsoft Excel source object to perform the specified operation and read data from the Microsoft Excel source.

You can switch mappings to advanced mode to include transformations and functions that enable advanced functionality.

Note: Microsoft Excel Connector supports files created in version Excel 2007 and onwards.

Microsoft Excel Connector assets

Create assets in Data Integration to integrate data using Microsoft Excel Connector assets.

When you use Microsoft Excel Connector, you can include the following Data Integration assets:

- Mapping
- Mapping task
- Synchronization task

For more information about configuring assets and transformations, see *Mappings*, *Transformations*, and *Tasks* in the Data Integration documentation.

The following table lists the object and task operations that Microsoft Excel Connector supports:

Object	Read	Insert	Update	Upsert	Delete	Data Preview	Look Up
Worksheet	Yes	NA	NA	NA	NA	Yes	NA

Note: Do not use hyphens (-) in worksheet names.

Microsoft Excel Connector Example

You are a business analyst and you want to import customer details from a Microsoft Excel file to Tableau and analyze the data.

You can use the Microsoft Excel Connector to connect to the Microsoft Excel file and read the data. You can create a synchronization task or a mapping task in Data Integration to read data from the Microsoft Excel file. After you read data from the Microsoft Excel file, you can reconcile and analyze the data, generate reports, or make decisions by using Tableau.

Administration of Microsoft Excel Connector

As a user, you can use Microsoft Excel Connector after the organization administrator performs the following tasks:

- Install Microsoft Excel Connector.
- Increase the Secure Agent memory to overcome memory issues that occur when you read from a file whose file size exceeds 1 GB.

CHAPTER 2

Microsoft Excel Connection

Create a Microsoft Excel connection to connect to a Microsoft Excel source and read data from it. You can specify the Microsoft Excel source in mappings, mapping tasks, or synchronization tasks.

You can create a Microsoft Excel source connection on the **Connections** page. Use the connection when you create a synchronization task or a mapping task.

Microsoft Excel connection properties

When you set up a Microsoft Excel connection, you must configure the connection properties.

The following table describes the Microsoft Excel connection properties:

Connection property	Description
Connection Name	Name of the connection. Each connection name must be unique within the organization. Connection names can contain alphanumeric characters, spaces, and the following special characters: _ . + -, Maximum length is 255 characters.
Description	Description of the connection. Maximum length is 4000 characters.
Use Secret Vault	Stores sensitive credentials for this connection in the secrets manager that is configured for your organization. This property appears only if secrets manager is set up for your organization. When you enable the secret vault in the connection, you can select which credentials that the Secure Agent retrieves from the secrets manager. If you don't enable this option, the credentials are stored in the repository or on a local Secure Agent, depending on how your organization is configured. **Note:** If you're using this connection to apply data access policies through pushdown or proxy services, you cannot use the Secret Vault configuration option. For information about how to configure and use a secrets manager, see "Secrets manager configuration" in the Administrator help.
Runtime Environment	The name of the runtime environment where you want to run the tasks. Select a Secure Agent or elastic runtime environment. For more information about how to configure and use the runtime environments, see *Runtime Environments* in the Administrator help.

Connection property	Description
Folder URI	The directory that contains the Microsoft Excel files that you want to read. The directory must be located on the Secure Agent machine.
Treat First Row As Header	Specifies whether the first row of the file should be treated as a header row. Select true or false.
Folder Access	Reads multiple Microsoft Excel files from the directory specified in the Folder URI property. By default, the checkbox is not selected.
Filename	The name of the Microsoft Excel file that you want to read. When you select the Folder Access option to read from multiple files, you must specify the name of at least one of the files from the directory specified in the Folder URI connection property. The file name must have the `.xlsx` extension. Do not use hyphens (-) in file names.

CHAPTER 3

Synchronization Tasks with Microsoft Excel

Use the Synchronization task to synchronize data between a source and target.

You can configure a synchronization task using the Synchronization Task wizard.

When you create a task, you can associate it with a schedule to run it at specified times or on regular intervals. Or, you can run it manually. You can monitor tasks that are currently running in the activity monitor and view logs about completed tasks in the activity log.

Microsoft Excel Sources in Synchronization Tasks

You can use a single Microsoft Excel source object in a synchronization task.

You configure Microsoft Excel source properties on the **Source** page of the Synchronization Task wizard.

The following table describes the Microsoft Excel source properties:

Property	Description
Connection	Name of the source connection.
Source Type	Select Single.
Source Object	Name of the source object. The source object corresponds to the worksheet present in the Microsoft Excel file used for creating the connection.

Microsoft Excel Source Synchronization Task Example

You want to import prospective inpatient payment details from a Microsoft Excel file to analyze the data.

Configure a synchronization task with the insert operation and configure the following objects:

Source

The source object for a synchronization task corresponds to worksheets present in the Microsoft Excel file used for creating a connection. Use the Microsoft Excel source connection to connect to the Microsoft Excel file and read data from the worksheet.

Target

Use a .csv file as the target object in the synchronization task. The target object file must contain the tables you select in the source object.

Mapping

Map the primary fields of the source object to the flat file target object.

Note: When you run the synchronization task, the Secure Agent writes the retrieved tables to the target `.CSV` file.

CHAPTER 4

Mappings and Mapping Tasks with Microsoft Excel

Use the Data Integration Mapping Designer to create a mapping. When you create a mapping, you configure a source to represent a single Microsoft Excel object.

In advanced mode, the Mapping Designer updates the mapping canvas to include transformations and functions that enable advanced functionality.

Describe the flow of data from source and target along with the required transformations before the Secure Agent writes data to the target. When you create a mapping task, select the mapping that you want to use. Use the mapping task wizard to create a mapping task. The mapping task processes data based on the data flow logic you define in the mapping.

Microsoft Excel Mapping Task Example

You want to import data from a Microsoft Excel file to analyze the data.

Configure a mapping task to use the insert operation. You use the following objects in the Microsoft Excel mapping:

Source object

The source object for a mapping task is a worksheet. Use the Microsoft Excel connection to connect to a Microsoft Excel file and read data from the Microsoft Excel file. The worksheet object is a single source in the mapping task.

Target object

Use a .csv file as the target object in the mapping task. The target in the mapping task is a flat file.

Mapping

Map the fields of the Microsoft Excel Worksheet source to the flat file target.

The following image shows the Microsoft Excel mapping:

When you run the mapping, the Secure Agent writes the data to the flat file based on the fields you mapped in the mapping task.

CHAPTER 5

Data Type Reference

Data Integration uses the following data types in mappings and synchronization tasks with Microsoft Excel:

Microsoft Excel Native Data Types

Microsoft Excel data types appear in the Source and Target transformations when you choose to edit metadata for the fields.

Transformation Data Types

Set of data types that appear in the transformations. They are internal data types based on ANSI SQL-92 generic data types, which the run-time environment uses to move data across platforms. Transformation data types appear in all transformations in mappings and synchronization tasks.

When Data Integration reads source data, it converts the native data types to the comparable transformation data types before transforming the data. When Data Integration writes to a target, it converts the transformation data types to the comparable native data types.

Microsoft Excel and Transformation Data Types

The following table describes the data types that Data Integration supports for Microsoft Excel sources:

Microsoft Excel Data Type	Transformation Data Type	Range and Description for the Transformation Data Type
STRING	String	1 to 104,857,600 characters

CHAPTER 6

Troubleshooting

Use the following sections to troubleshoot errors in Microsoft Excel Connector.

Troubleshooting for Microsoft Excel Connector

Source object returns blank or null values

When you read an Excel file with hidden corruption, formatting errors, or encoding issues, the fields might return blank or null values.

Workaround: To resolve this issue, perform the following steps:

1. Open the Excel file.
2. Save the file without making any changes.
   When you resave the file, Excel removes hidden corruption, formatting errors, and encoding issues.
3. Use the resaved file as the source object for your mapping.

Source object returns inaccurate header and field values

When you read a .xlsx file generated by certain tools, the headers and field values might be incorrect due to hidden metadata or improper formatting.

Workaround: To prevent processing errors caused by system-generated encoding, adhere to the following data preparation standards:

- Manually resave any generated file before you use it as a source object to eliminate incompatible metadata and encoding errors.
- Convert files to CSV in UTF-8 encoding format. Informatica Intelligent Cloud Services recommends CSV in UTF-8 encoding to eliminate parsing inconsistencies found in standard XLSX files.
- Remove merged cells, hidden formatting, and special encoding by saving the file in a standard, flat format.
