Abstract

This article describes frequently asked questions about using Google Cloud Storage Connector to read data from and write data to Google BigQuery.

Supported Versions

- Informatica Cloud Spring 2017

Performance Tuning Questions. 3

General Questions

What is Google Cloud Platform?

Google Cloud Platform is a set of public cloud computing services offered by Google. It provides a range of hosted services for compute, storage, and application development that runs on Google hardware. Google Cloud Platform services can be accessed by software developers, cloud administrators, and other enterprise IT professionals over the public internet or through a dedicated network connection.

Google Cloud Platform provides Google Cloud Storage for global storage and retrieval of large volumes of data at any time.

How can I access Google Cloud Platform?

You must create a Google service account to access Google Cloud Platform. To create a Google service account, click the following URL: https://cloud.google.com/

What are the operations that Informatica Cloud supports for Google Cloud Storage Connector?

You can use Google Cloud Storage Connector to read data from and write data to Google Cloud Storage. You can perform the insert operation when you write data to a Google Cloud Storage target.

What types of file formats and data can I read from a Google Cloud Storage source?

You can use Google Cloud Storage Connector to read any file that contains string and binary data.

What types of file formats and data can I write to a Google Cloud Storage target?

You can use Google Cloud Storage Connector to write to any file that contains text, string, and binary data.

Does Google Cloud Storage Connector support both the Informatica Cloud Hosted Agent and the Secure Agent?

Yes. Google Cloud Storage Connector supports both the Informatica Cloud Hosted Agent and the Secure Agent.

What information do I need to create a Google Cloud Storage connection?

Before you create a Google Cloud Storage connection, you must have the following information:

- Runtime Environment. Name of the runtime environment where you want to run the tasks.
- Service Account ID. The client_email value present in the JSON file that you download after you create a Google service account.
- Service Account Key. The private_key value present in the JSON file that you download after you create a Google service account.

- Project ID. The project_id value present in the JSON file that you download after you create a Google service account.
- File Path. Path in Google Cloud Storage where you want to read or write data.

For more information about creating a Google Cloud Storage connection, see the Informatica Cloud Google Cloud Storage Connector Guide.

What are the data types that Informatica Cloud supports for Google Cloud Storage sources and targets?

Informatica Cloud supports byte and string data for Google Cloud Storage sources and targets.

Performance Tuning Questions

How do I configure the Number of Threads for Uploading Data to the Target option to improve performance?

You can configure multi-threading to write data to the Google Cloud Storage target in parallel and improve the performance. Set the **Number of Threads for Uploading Staging File** option to 5 or 10. This recommendation is based on observations in an internal Informatica environment using data from real-world scenarios. The performance might vary based on individual environments and other parameters. You might need to test different settings for optimal performance.

If you configure more than one thread, you must increase the Java heap size in the **JVMOption3** field for DTM under the **System Configuration Details** section of the Secure Agent. You must then restart the Secure Agent for the changes to take effect.

Should I configure the Order Target Data option when I write to a Google Cloud Storage target?

You can select the **Order Target Data** option if you want the Secure Agent must retain the order of text data when it writes to the Google Cloud Storage target. You can retain the order of text data if you configure more than one thread to write text data to a Google Cloud Storage target.

Note: The **Order Target Data** option is not applicable for binary and string data types.

Ordering data might cause a performance degradation because the data needs to be staged. If the order of the text data is not important, clear the Order Target Data option to improve the performance.
