Informatica

Mappings in Advanced Mode
Quick Reference

Create a mapping in advanced mode to process advanced functionality such as multilevel hierarchical data, embedded code snippets, and workloads at any scale. The mapping can run on an advanced cluster in addition to the Secure Agent, enabling complex processing capabilities for your organization.

Use this Quick Reference to find the information that you need about advanced mode.

Learn about Informatica Intelligent Cloud Services

To use mappings in advanced mode, you'll mainly work in Data Integration. Data Integration is a service that provides a complete platform to create and run data integration jobs. You'll also use two common services, Administrator and Monitor, to manage your organization and to monitor advanced clusters and jobs.

Tasks	Where to find documentation
1. Read an introduction to Data Integration.	Introducing Informatica Cloud Data Integration
2. Get familiar with the steps to create a data integration project.	Getting started with Informatica Cloud Data Integration
3. Learn how you can use Administrator to manage your organization.	Introducing Administrator
4. Learn about the Monitor user interface that you use to monitor advanced clusters and jobs.	Monitoring jobs

Informatica

Set up your cloud environment

You can begin developing and testing mappings in advanced mode using any runtime environment, even if it's not associated with an advanced configuration, and the agent will create a local cluster for you to use. You can also set up your cloud environment to host your own fully-managed, self-service, or local cluster, or you can create a serverless runtime environment that provides an advanced cluster for your organization.

Tasks	Where to find documentation
1. Create a runtime environment.	Runtime environments
2. Create connections to access source and target data.	Connectors and connections
3. Set up your cloud environment to host an advanced cluster.	Advanced clusters
4. Create an advanced configuration.	Advanced configurations

Create a mapping in advanced mode

To create a mapping in advanced mode, create a mapping and then click Switch to Advanced in the Mapping Designer. You can add transformations, functions, and components to define the data flow.

Tasks	Where to find documentation
1. Create a mapping in advanced mode.	Mappings Mappings in advanced mode
2. Add transformations to the mapping to transform the data.	Transformations Transformations in advanced mode
3. Use functions to write expressions and configure conditions in the transformations.	Function reference Functions in advanced mode
4. Create components to use in the mapping.	Components

Informatica

Create and run a mapping task

Create a mapping task to run the data logic in the mapping. In advanced mode, Data Integration selects a runtime plan for each transformation. The runtime plan determines whether the transformation runs on an advanced cluster or on the Data Integration Server, which is a Secure Agent service.

Tasks	Where to find documentation
1. Create a mapping task and run the task.	Mapping tasks
2. Optionally, add the mapping task to a task-flow and run the taskflow.	Taskflows

Monitor the job and the cluster

When you run a mapping in advanced mode, Data Integration creates a job with one or more Data Integration Server subtasks and one or more advanced cluster subtasks. You can monitor the job and the subtasks to view details such as job status and any error messages. You can also monitor the advanced cluster to view cluster status and activity, such as scale-up and scale-down events.

Tasks	Where to find documentation
1. Monitor the job.	Monitoring mappings and tasks in advanced mode Monitoring advanced cluster subtasks Viewing log files for advanced cluster subtasks
2. Monitor the advanced cluster.	Monitoring advanced clusters
3. Troubleshoot the job or the advanced cluster.	Troubleshooting
