Informatica

Advanced Clusters
Quick Start

An advanced cluster is a Kubernetes cluster that provides a distributed processing environment on the cloud to run the data logic in a mapping in advanced mode.

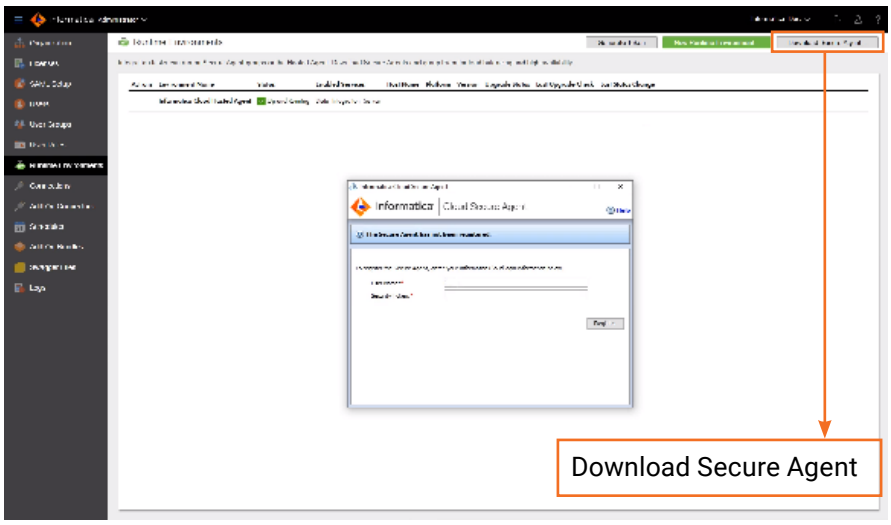

Advanced clusters can be fully-managed, self-service, or local clusters, and they can run in a serverless runtime environment. You can use a local cluster to quickly begin developing and testing advanced functionality. As you develop larger data integration projects, you can set up a fully-managed or self-service cluster or a serverless runtime environment that provides an advanced cluster for you to use.

Use this Quick Start to set up your first advanced cluster. Perform the following steps:

Informatica

Set up your cloud environment

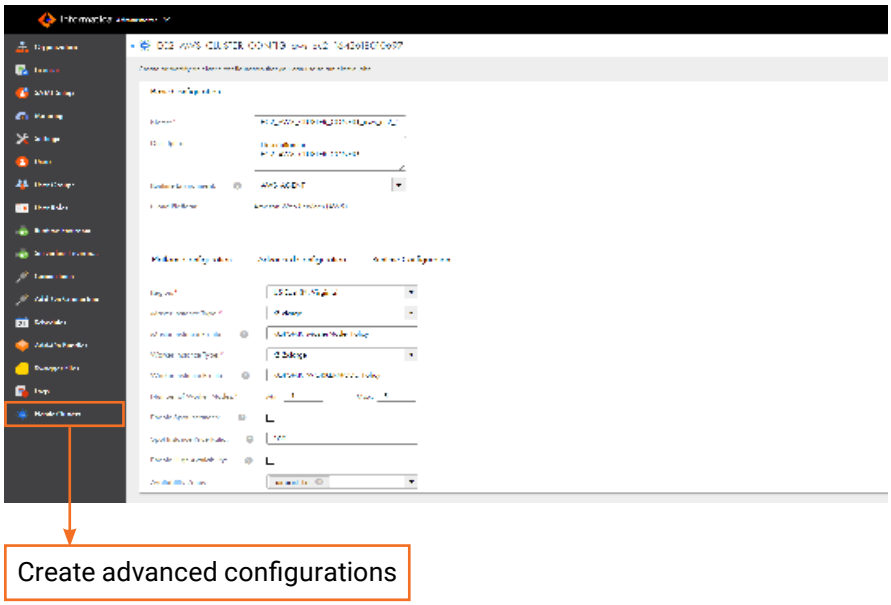

Download and install a Secure Agent on a virtual machine in your cloud environment, and set up your cloud environment based on the cluster type and the cloud platform.

For a fully-managed cluster, learn how to set up AWS, Google Cloud, or Microsoft Azure.

You can also set up a self-service cluster, or a local cluster.

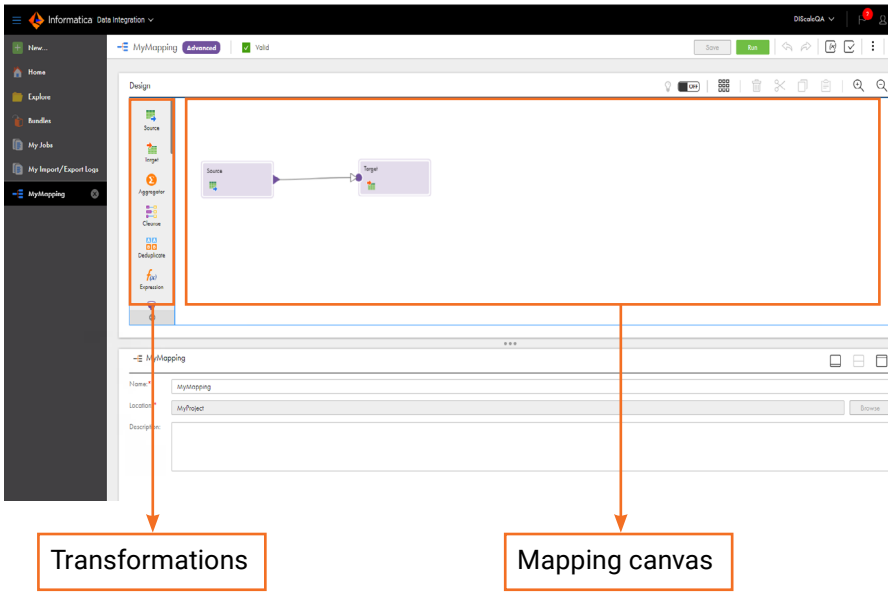

Create an advanced configuration

1. In Administrator, open the Advanced Clusters page.
2. Create an advanced configuration.
3. Configure the cloud resources that define the cluster.

Learn more about advanced configurations.

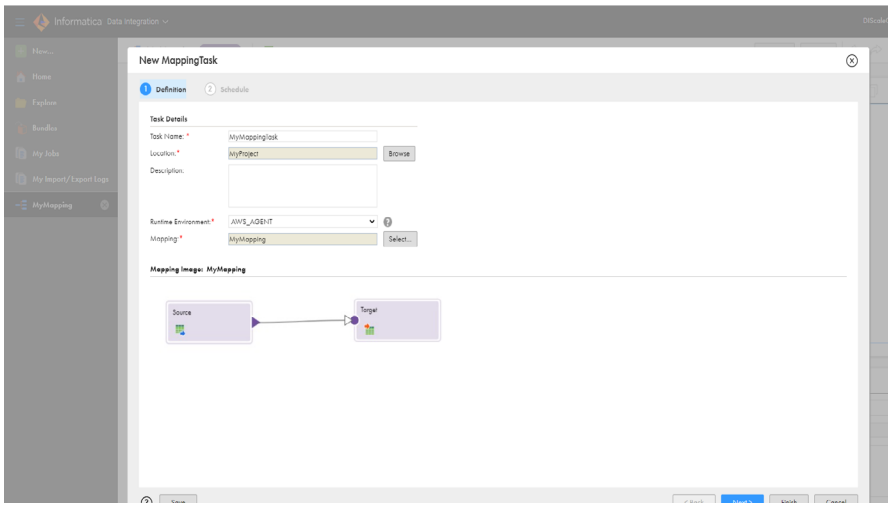

Create a mapping in advanced mode

1. In Data Integration, select **New** > **Mapping**.
2. In the Mapping Designer, click Switch to Advanced.
3. In the mapping, define the data flow logic from a source to a target.

Learn more about mappings and mappings in advanced mode.

Create and run a mapping task

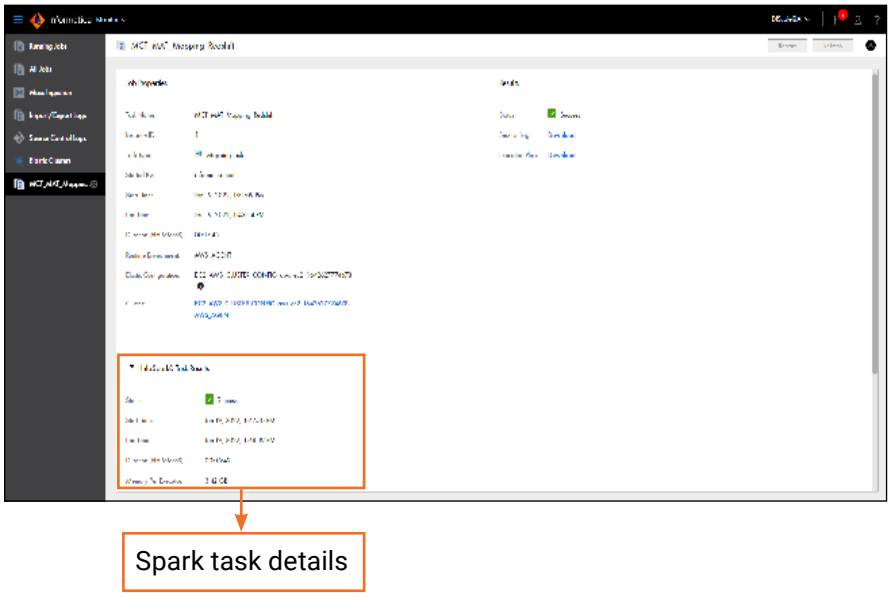

1. In the Mapping Designer, click **Actions** > **New Mapping Task**.
2. Select the runtime environment that's associated with the advanced configuration.
3. Configure the rest of the mapping task properties to create the task.
4. In the mapping task, click **Run**.

To run the mapping task, the runtime environment creates or connects to an advanced cluster that processes the data logic.

Learn more about mapping tasks.

Informatica

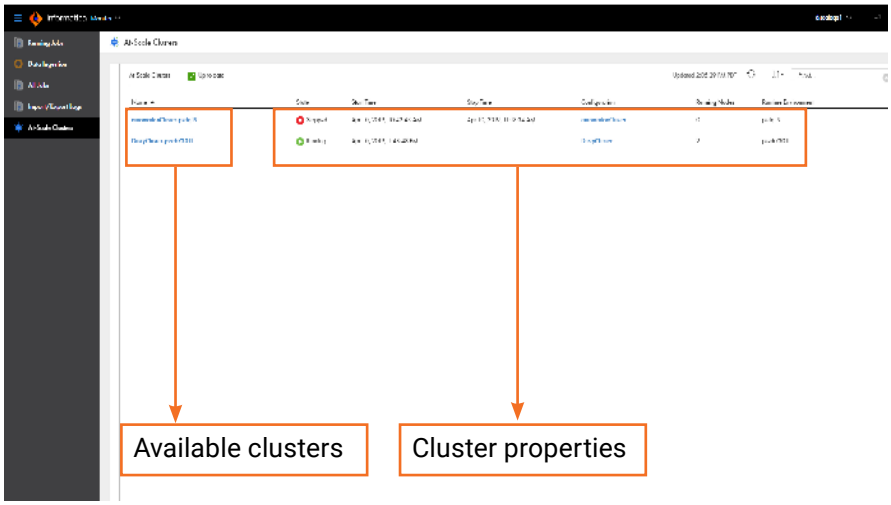

Monitor the job

1. Open the My Jobs page.
2. Select the job.
3. Drill down on the subtask that runs on the advanced cluster.
4. Review the results of the subtask and the Spark task details.

Learn more about monitoring mappings in advanced mode and monitoring advanced cluster subtasks.

Monitor the advanced cluster

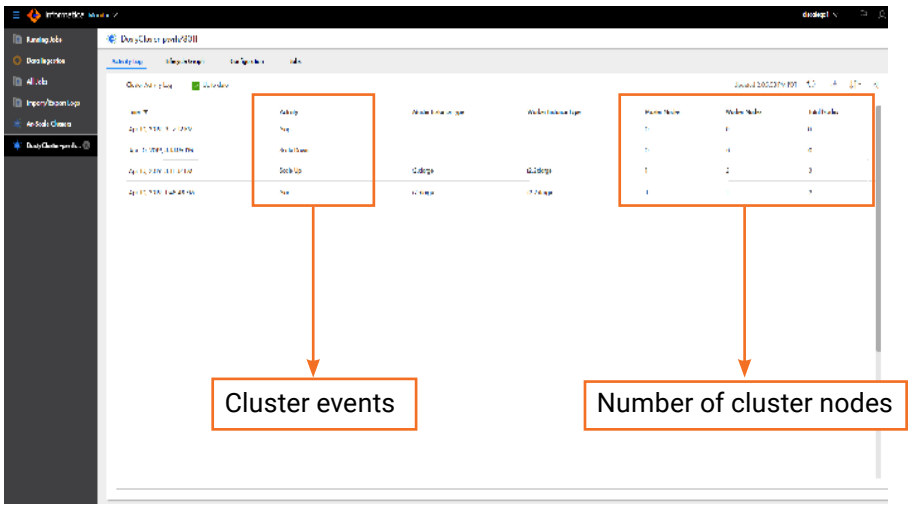

For each advanced cluster, you can view an activity log, a lifecycle graph, the advanced configuration, and the jobs that run on the cluster.

1. In Monitor, open the Advanced Clusters page.
2. Select the advanced cluster.
3. View the cluster properties.

Learn more about monitoring advanced clusters.

Review the activity log

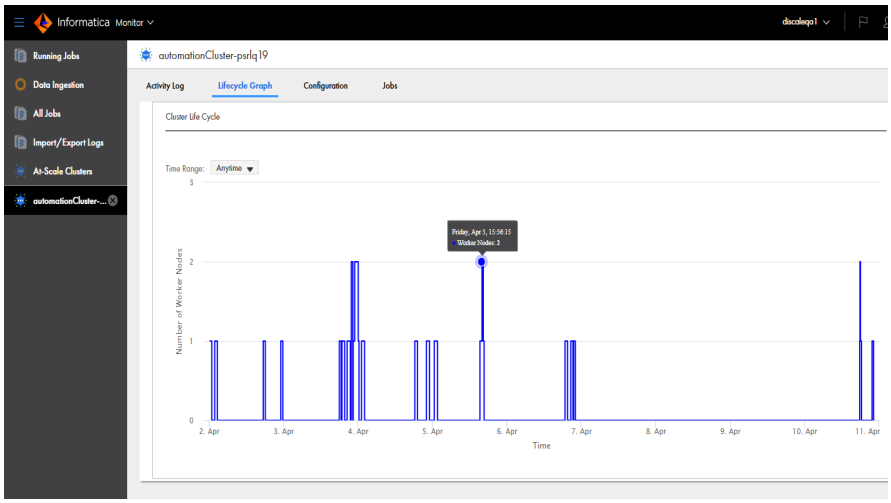

4. Select the cluster instance.
5. View the activity log.

The activity log lists the events that occur on the cluster, such as startup and auto-scaling events.

Learn more about the activity log.

Review the lifecycle graph

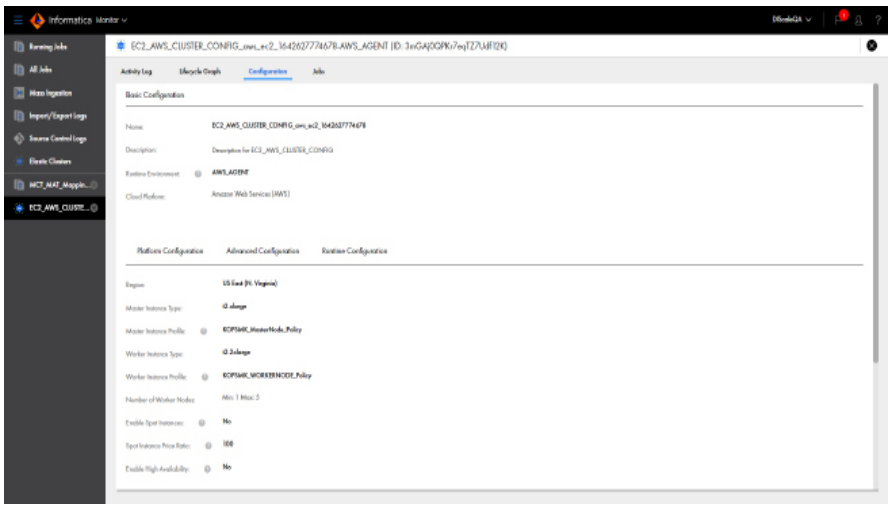

6. Select the lifecycle graph.
7. View the changes in the number of worker nodes over time.

The number of worker nodes changes as the Secure Agent auto-scales the cluster based on your workload.

Learn more about the lifecycle graph.

Informatica

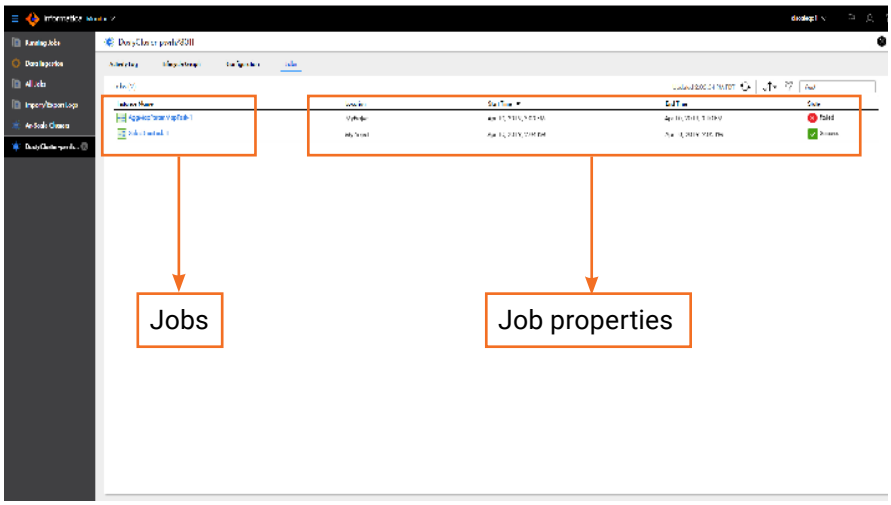

Review the advanced configuration

8. Select the configuration.
9. Review the resources that define the advanced cluster.

The advanced configuration that you view in Monitor is read-only.

Review jobs

10. Select the jobs on the cluster.
11. Monitor the jobs that are running and the jobs that have completed.

You can analyze jobs to debug both the jobs and the advanced cluster.

Learn more about monitoring jobs on an advanced cluster.
