Informatica

Cloud Data Integration Quick Start Guide

Informatica Cloud Data Integration provides a complete platform for cloud integration and data management. Data Integration is one of the services available in Informatica Intelligent Cloud Services. You can use Data Integration to build and run advanced, complex integrations using pre-built functions and templates for mappings and transformations. Use Data Integration to manage your data integration projects, create assets, and run tasks and taskflows.

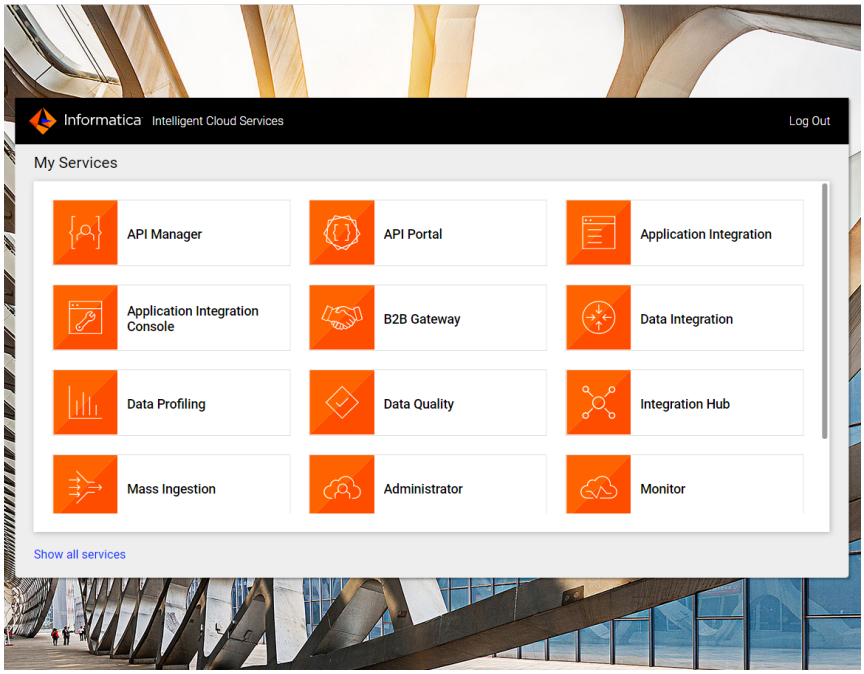

Use this Quick Start Guide to get started with Data Integration. For information about getting started with Data Integration Elastic, refer to the Data Integration Elastic Quick Start Guide.

To set up Data Integration, we will also use the Administrator service. Perform the following steps:

Informatica

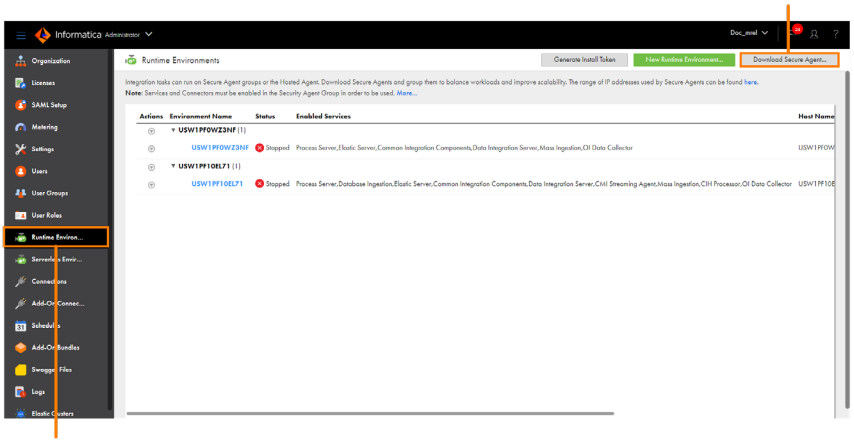

Verify system requirements

1. Check the Informatica Intelligent Cloud Services Product Availability Matrix for operating systems, databases, and other systems that Data Integration supports.
2. Log in to Informatica Intelligent Cloud Services using a supported browser.

To learn more, refer to the Product Availability Matrix.

Configure a runtime environment

A runtime environment is the execution platform that runs all assets. It contains one or more Secure Agents.

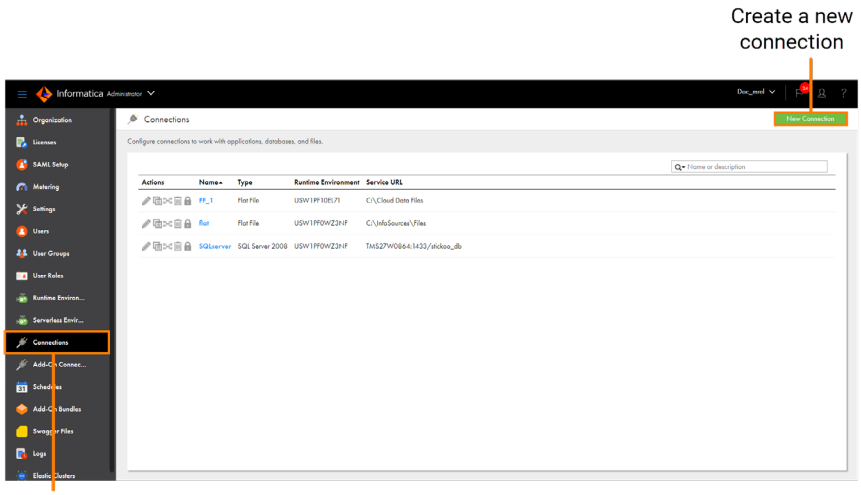

1. In Administrator, open the Runtime Environments page.
2. Download and install a Secure Agent onto a physical or virtual machine.
3. Balance the workload across multiple machines by grouping multiple Secure Agents.

Learn how to install a Secure Agent on Windows or Linux.

Learn more about Secure Agent groups.

Learn about using the Informatica Hosted Agent.

Create connections

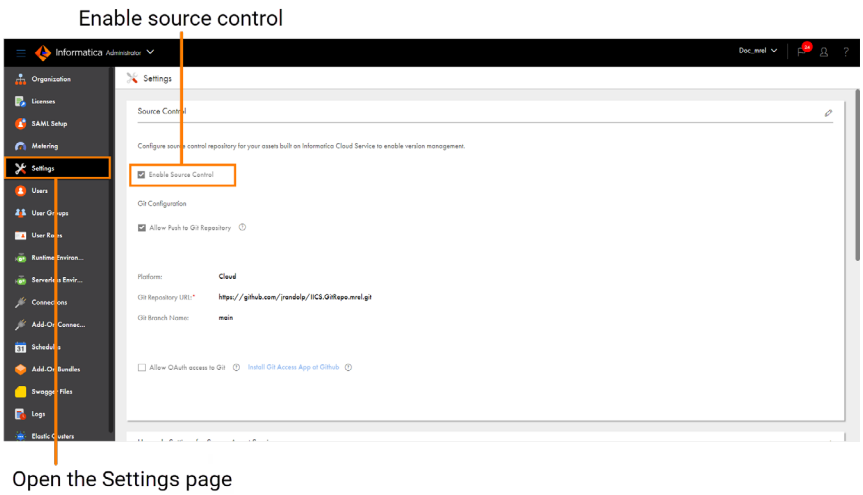

Create connections to access your data. Use connectors to create connections.

1. If necessary, install the add-on connector.
2. In Administrator, open the Connections page.
3. Click Create New Connection.
4. Configure connection details.
5. Test the connection.

The details that you configure depend on the connection type.

Learn about connection properties and the various connectors that you can use.

Configure source control (optional)

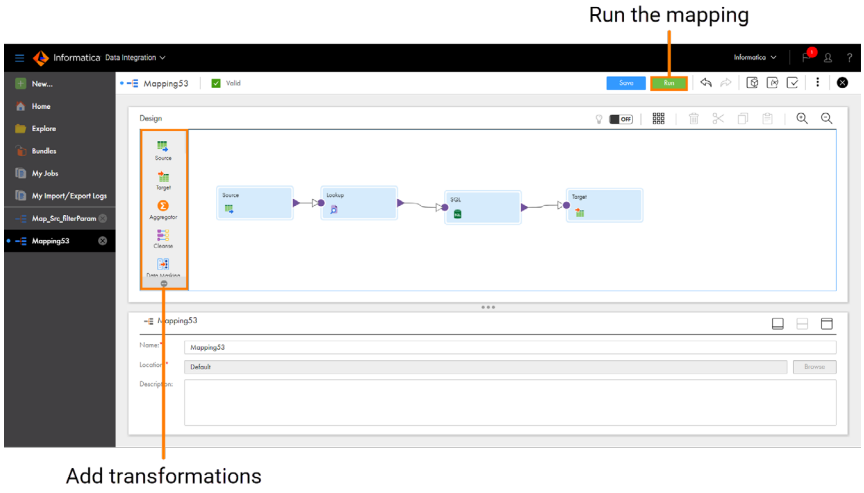

Configure source control to enable version management for projects, folders, and assets.

1. In Administrator, open the Settings page.
2. Enable source control and link your organization to your source control repository.
3. In Data Integration, check in your objects.

Learn more about enabling source control.

Create and run mappings

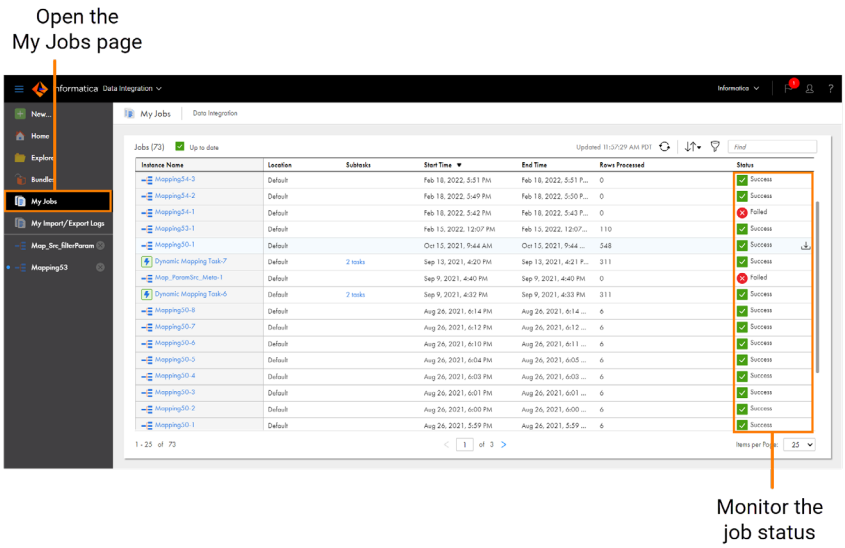

Create mappings to define the flow of data.

1. In Data Integration, click New > Mapping > Create.
2. Configure the flow of data from your source to your target.
3. Run the mapping.

You can also create a mapping task based on the mapping.

Learn about mapping templates and creating custom mappings.

Monitor the job

1. In Data Integration, open the My Jobs page.
2. Monitor the job status.
3. If the job encounters errors, download the log file to troubleshoot.

You can also stop and restart jobs.

Next Steps

1. Create tasks, taskflows, and components. Learn about the different types of tasks and taskflows that you can create. Learn about the different components that you can create and use in mappings.
2. If you are an organization administrator, set up sub-organizations, sandbox organizations, or additional production organizations.
3. Configure your user profile.
