Preface

Read *What's New* to learn about new features, enhancements, and changed behaviors in API Center for the October 2026 release.

Informatica Resources

Informatica provides you with a range of product resources through the Informatica Network and other online portals. Use the resources to get the most from your Informatica products and solutions and to learn from other Informatica users and subject matter experts.

Informatica Documentation

Use the Informatica Documentation Portal to explore an extensive library of documentation for current and recent product releases. To explore the Documentation Portal, visit https://docs.informatica.com.

If you have questions, comments, or ideas about the product documentation, contact the Informatica Documentation team at infa_documentation@informatica.com.

IDMC web site

You can access the Informatica® Intelligent Data Management Cloud™ (IDMC) web site at http://www.informatica.com/cloud.

IDMC Communities

Use the IDMC Community to discuss and resolve technical issues. You can also find technical tips, documentation updates, and answers to frequently asked questions.

Access the IDMC Community at:

https://network.informatica.com/community/informatica-network/products/cloud-integration

Developers can learn more and share tips at the Cloud Developer community:

https://network.informatica.com/community/informatica-network/products/cloud-integration/cloud-developers

IDMC Marketplace

Visit the Informatica Marketplace to try and buy Data Integration Connectors, templates, and mapplets:

https://marketplace.informatica.com/

Data Integration connector documentation

You can access documentation for Data Integration Connectors at the Documentation Portal. To explore the Documentation Portal, visit https://docs.informatica.com.

Informatica Knowledge Base

Use the Informatica Knowledge Base to find product resources such as how-to articles, best practices, video tutorials, and answers to frequently asked questions.

To search the Knowledge Base, visit https://search.informatica.com. If you have questions, comments, or ideas about the Knowledge Base, contact the Informatica Knowledge Base team at KB_Feedback@informatica.com.

IDMC Trust Center

The IDMC Trust Center provides information about Informatica security, compliance, and privacy practices.

You can access the trust center at https://trust.informatica.com/.

IDMC Pulse Dashboard

The IDMC Pulse Dashboard provides system status and upgrade information for all PODs and services across IDMC.

Follow the services you use and subscribe to alerts to receive notifications about upgrades, maintenance, production incidents, and upcoming releases. The IDMC Pulse Dashboard displays the production status of all the IDMC products. All maintenance updates are posted to this page, and during an outage, it will have the most current information. To ensure you are notified of updates and outages, you can subscribe to receive updates for a single service or all IDMC services. Subscribing to all services is the best way to be certain you never miss an update.

For more information, see the Service Status and Communications guide.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the IDMC Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.

CHAPTER 1

October 2026

The October 2026 release of API Center includes the following updates.

Changelog October 2026

Read the changelog to learn about significant changes to this publication for this release.

The following table describes changes in this publication:

Publication Date	Type of Change	Section Title
September 10, 2026	Initial publication	

New features and enhancements

The October 2026 release of API Center includes the following new features and enhancements.

Data Quality mapplet import to API Center

You can import Data Quality mapplets along with rule specifications to API Center to design and publish an API endpoint. When you create an API for Data Quality, you select the rule specifications and mapplets that you have enabled in Data Quality.

For more information, see https://docs.informatica.com/ipaas/api-center/current-version/rest-api-assets/rest-api-assets/api-definition/importing-data-quality-assets.html in the *REST API Assets* help.

Source control

You can use a source control repository with IDMC to manage and track changes made to IDMC objects such as projects, folders, and assets.

Your organization can be configured to have read/write access or read-only access to the source control repository. If you have read/write access, you can check in and check out objects, pull versions of objects, and revert objects to a previous version.

If you have read-only access, you can pull versions of source-controlled objects from the repository. However, you can't check out or check in objects.

You can use Atlassian Bitbucket, GitHub, GitLab, or a cloud-hosted Azure DevOps Git repository with IDMC to manage and track changes made to objects such as projects, folders, and assets. For more information about the available source control repositories, see *Source control configuration* in the *Administrator* help.

For more information about source control, see *Asset Management*.

For information about your organization's configuration, contact your organization administrator.

Changed behavior

The October 2026 release of API Center includes the following changed behavior.

Multiple request methods for custom APIs

When you publish a custom API in API Center, you can select one or more request methods. Based on the request methods you select, you can handle multiple operations through one URL instead of multiple separate URLs.

Previously, you could select only one request method for each custom API. To handle multiple methods for the same resource, you had to create and manage separate URLs for each method.

For more information, see https://docs.informatica.com/ipaas/api-center/current-version/manage-apis/custom-apis/publishing-a-custom-api.html in the *Manage APIs* help.

Improved sorting, searching, and inline filtering on the API Center pages

API Center has improved sorting, searching, and inline filtering across its pages, including the **Published APIs**, **Managed APIs**, **Managed API Groups**, and **Configuration** pages.

Search now queries across all pages, so you can find results that aren't visible on the page that you view. You can use inline filters for the protocol and version fields to narrow results directly within a page.

Previously, search on these pages highlighted matches only within the current page.

For more information, see *Introducing API Center*.

Selection-based asset list in the Data Quality API creation flow

When you create an API for Data Quality, you now select rule specifications and mapplets from a filtered list to quickly find the assets you want.

Previously, these assets were only presented in a flat list.

For more information, see https://docs.informatica.com/ipaas/api-center/current-version/rest-api-assets/rest-api-assets/api-definition/importing-data-quality-assets.html in the *REST API Assets* help.

CHAPTER 2

April 2026

The April 2026 release of API Center includes the following updates.

Changelog April 2026

Read the changelog to learn about significant changes to this publication for this release.

The following table describes changes in this publication:

Publication Date	Type of Change	Section Title
April 22, 2026	Added	"Preview initiated" on page 9
March 11, 2026	Initial publication	

Important notices

The April 2026 release of API Center includes the following important notice.

Preview initiated

Manage APIs in an elastic runtime environment on Kubernetes

Effective in the April 2026 release, you can configure and auto-scale your Secure Agent infrastructure on public and external clouds using Kubernetes orchestration. You can now run API Center within an elastic runtime environment on Kubernetes.

For more information, see the Manage APIs in an elastic runtime environment on Kubernetes Knowledge Base article.

Technical preview functionality is supported for evaluation purposes but is unwarranted and is not supported in production environments or any environment that you plan to push to production. Informatica intends to include the preview functionality in an upcoming release for production use, but might choose not to in accordance with changing market or technical circumstances. For more information, contact Informatica Global Customer Support.

New features and enhancements

The April 2026 release of API Center includes the following new features and enhancements.

Import and export assets

If you are assigned the Administrator role, you can export the following asset types from an organization and import them into another organization:

- Published APIs
- Managed APIs
- API groups
- Managed API groups

This enhancement gives you the flexibility to transfer assets across organizations without needing to re-create them.

For more information, see *Asset Management*.

Export duplicate assets

If you are assigned an Administrator or Deployer role, you can export and rename the following asset types:

- Published APIs
- Managed APIs
- API groups
- Managed API groups

You can make an asset with the same name exportable in the same location. When you export duplicate asset, API Center appends a timestamp after the asset name.

To rename the duplicate asset, use the **Rename** option from the **Actions** menu.

For more information, see *Asset Management*.

Move folders and assets

You can move folders and assets on the **Explore** page.

However, you can't move an asset to a folder that contains an asset of the same type and name. You can't move a design API from one location to another.

For more information, see *Asset Management*.

Auto-populate path and query parameters

When you define operation parameters for a REST API and you enter path parameters or query parameters, the parameters are automatically detected and added to the parameters table.

When you define an endpoint, any placeholder enclosed in curly braces (for example, `/users/{userId}`) are automatically added to the **Path parameters** section of the **Parameters** table. This is a unidirectional process, which means that the data flows only from the endpoint definition to the table. You can't manually add or delete these auto-populated parameters in the table. You can't edit the parameter key, but you can edit the data type and description of the key parameters.

Query parameters are separated from the URL by a question mark (`?`). Query parameters synchronize bidirectionally. Changes made in the endpoint URL are instantly reflected in the **Query parameters** section of the **Parameters** table, and any parameters added or edited in the table automatically updates the URL. Use the table provides to add, delete, and edit parameter attributes.

For more information, see *REST API Assets*.

View OAuth 2.0 Client details

To cater to API auditing requirements, API Center now provides a new **View OAuth 2.0 Client** dialog box to display the OAuth 2.0 client details.

This view includes the OAuth 2.0 Client's name, description, ID and token details, associated resources, such as managed APIs and API groups, and important timestamps.

For more information, see *API Policies*.

HEAD method support for GET APIs

To ensure full HTTP standards compliance and improve compatibility with a wider range of API clients, all GET APIs now automatically support the HEAD HTTP method.

When a HEAD request is sent to a GET endpoint, the API returns only the metadata of the response headers without the message body, as specified by the HTTP standard.

The Swagger definition doesn't contain explicit details for the HEAD method. The HEAD method automatically inherits all rate limit and authorization policies from the corresponding GET method.

Changed behavior

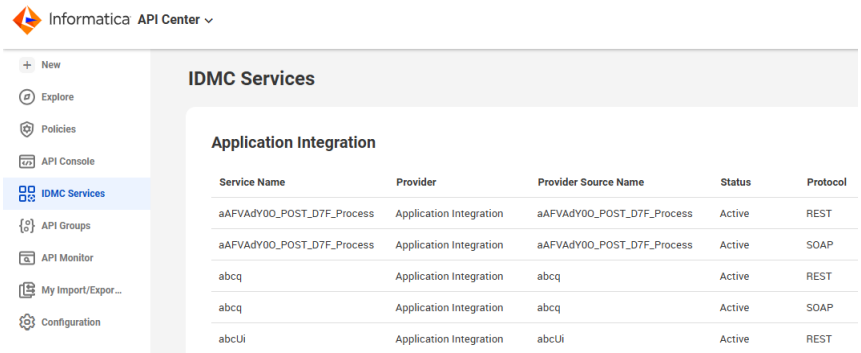

The April 2026 release of API Center includes the following changed behavior.

Services tab relocation for easier access

Effective in the April 2026 release, the **Services** tab is renamed to **IDMC Services** and is moved to a new, top-level entry in the main left-side navigation panel. The relocation provides easier and more direct access to the list of Application Integration processes used for creating published APIs.

You can view the **IDMC Services** page if you are assigned an Administrator or Deployer role.

The following image shows the new location of the **IDMC Services** tab:

Previously, the **Services** tab was available as a tab in the **API Console** page.

For more information, see *Introducing API Center*.

Asset types on the Explore page

On the **Explore** page, select **Explore By Asset Types** to view assets of a particular type. The asset type list now displays the following asset types:

- APIs

- API Groups
- Managed APIs
- Managed API Groups
- Policies
- Published APIs

Previously, you could view only the following asset types:

- APIs
- Policies

For more information, see *Introducing API Center*.

Asset columns on the Explore page

You can now view the properties of an asset from the **Actions** menu of that particular asset. For example, to view the properties of an asset, click the **Actions** menu on the row of the asset and select **Properties**. All properties relevant to the particular asset appear.

Previously, all the properties of all the assets appeared on the **Explore** page, making it difficult to comprehend.

For more information, see *Introducing API Center*.

Clickable asset names for faster navigation

To improve usability, asset names throughout all list pages in API Center are now clickable links. You can simply click on an asset's name to navigate directly to its details page. Depending on your role, the asset will open in either the edit mode or the view mode.

Previously, the asset names were not clickable.

For more information, see *Introducing API Center*.

User interface changes

The following table shows the user interface changes done in the April 2026 release:

Page or Tab Name	Old Field	New Field
API Design page Operation Policies tab	Select a policy from the drop-down list.	**Browse** to select an available policy.

CHAPTER 3

October 2025

The October 2025 release of API Center includes the following updates.

Important notices

The October 2025 release of API Center includes the following important notices:

Preview lifted

Effective in the October 2025 release, import of Data Quality rule specifications directly into API Center is production-ready. Previously, this functionality was only available in preview.

All Data Quality operations must use a session ID based authentication policy.

For more information, see *REST API Assets*.

JSON web tokens

Effective November 3, 2025, your organization administrator can change the authentication type used for REST API requests. If the administrator selects the JSON Web Token (JWT) authentication type, the JWT token has a fixed expiry period. Custom scripts need to handle automatic re-authentication before or after the token expires. For more information, see the JWT Support Knowledge article.

New features and enhancements

The October 2025 release of API Center includes the following new features and enhancements.

Create designed APIs from existing published REST APIs

You can create a designed API from a published REST API if the REST API was created from an existing Application Integration process. You can generate or change the design of the APIs that you publish using the bottom-up or implementation-first approach. If you had previously published an API in API Manager and migrated the API to API Center, you can update the API in API Center by creating a designed API. You can update and activate only the REST APIs that are directly published from existing Application Integration processes.

For more information, see *Manage APIs*.

Import and export assets

You can now export API Center assets, such as, APIs and policies, from an organization and import them into another organization. This enhancement gives you the flexibility to transfer assets across organizations without needing to re-create them.

You can import and export the following types of assets:

- Policies
- Design APIs
- Application Integration processes and dependent objects

For more information, see *Asset Management*.

View asset dependencies

You can view object dependencies for an asset. You can view the objects that the selected asset uses and the objects that use the selected asset.

You might want to view object dependencies before performing certain operations on an asset. For example, you can't delete an asset if another object depends on the asset.

For more information, see *Asset Management*.

Domain-level IP filtering

You can use the **Domain IP Filtering** policy to manage IP-based access control for all managed APIs, managed API groups, and custom APIs within your organization. This policy defines access rules that either allow or deny IP addresses permission to invoke any API in your organization.

If you configure both managed API or managed API group and domain IP filtering policies, the managed API or managed API group policies take precedence over domain IP filtering policies.

For more information, see *API Policies*.

New Consumer column added to the Activity Log tab on the API Monitor page

The **Activity Log** tab on the **API Monitor** page now includes a new column named **Consumer**. Using the **Consumer** column, you can get insights into the users who invoked the APIs.

For more information, see *Monitor APIs*.

Import Data Quality assets

You can import a Data Integration mapplet that contains Data Quality transformations as an API. You can then design a custom endpoint to expose the mapplets, enabling seamless integration and use of Data Quality capabilities through the API.

For more information, see *REST API Assets*.

Changed behavior

The October 2025 release of API Center includes the following changed behavior.

Editing policies of active managed APIs and managed API groups

You can now update the policies of your managed APIs and managed API groups that are in the active, shared, and deprecated state.

Previously, to edit a managed API's policies, you had to deactivate it, causing token invalidation and downtime.

Viewing and accepting updates for managed APIs at run time

You can now edit the design of a managed API at run time. When you update the API design, save your changes, and publish the API, your changes are immediately visible on the **Managed APIs** tab. When you accept the changes, the changes are applied to the managed API at run time.

Previously, to edit a managed API or use the same context after the managed API is activated, you had to deactivate the managed API and then create a new managed API from the published API. Alternatively, you had to create a new managed API from the published API.

For more information, see *Manage APIs*.

CHAPTER 4

July 2025

The July 2025 release of API Center includes the following updates.

Important notices

The July 2025 release of API Center includes the following important notice:

Preview initiated

Effective in the July 2025 release, import of Data Quality rule specifications directly into API Center is available for preview. All Data Quality operations must use a session ID based authentication policy.

For more information, see *REST API Assets*.

Preview functionality is supported for evaluation purposes but is unwarranted and is not supported in production environments or any environment that you plan to push to production. Informatica intends to include the preview functionality in an upcoming release for production use, but might choose not to in accordance with changing market or technical circumstances. For more information, contact Informatica Global Customer Support.

New features and enhancements

The July 2025 release of API Center includes the following new features and enhancements.

New session ID authentication method

You can assign the new session ID authentication method to APIs and operations. If you create an API by importing a Data Quality asset, use only the session ID authentication method.

For more information, see *API Policies*.

Ability to view published API details

If you are assigned the Admin or Deployer role, you can view and verify the details of a published API before you create a managed API from it. You can view the API-level rate limit policies and operation-level policies in read-only mode. You can view the API-level security and privacy policies under the operational-level policies if the operational-level policies inherit the API-level policies.

You can view the details of the following types of published APIs:

- REST APIs that were published using the top-down approach or bottom-up approach

- SOAP APIs that were published using the bottom-up approach
- Custom REST and SOAP APIs

For more information, see *Manage APIs*.

Changed behavior

The July 2025 release of API Center includes the following changed behavior.

OAuth 2.0 security authentication for API groups

When you create or edit an API group or managed API group, you can enable OAuth 2.0 authentication at the API group level. You can then invoke the APIs in the managed API group with OAuth 2.0 or third-party authorization access tokens.

When you enable API-level authentication for an API group, all the operation-level authentications are overridden. However, this behavior doesn't apply to custom API operations.

Previously, you couldn't enable OAuth 2.0 authentication at the API group level. You could enable OAuth 2.0 authentication only at the operation level.

For more information, see *Manage APIs*.

Naming convention changes

To include OAuth 2.0 authentication at the API group level, a field has been renamed as described in the following table:

Page or Tab Name	Old Field Name	New Field Name
API Groups page > API Groups tab > <Create or edit an API group> > Policies tab	**JWT Access Token**	**Security**
API Groups page > Managed API Groups tab > <Create or edit a managed API group> > Policies tab	**JWT Access Token**	**Security**

For more information, see *Manage APIs*.

Inclusion of query parameters in managed and custom managed API endpoint URLs

When your REST API operation endpoint includes query parameters, API Center now automatically displays the complete endpoint URL with those parameters for both managed APIs and custom managed APIs. This enhancement ensures consistency between your endpoint definitions and query parameter configurations.

In a managed API, you can use the following formats for query parameters:

- Query key (`?param`)
- Query key with equals (`?param=`)
- Query key and value (`?param=value`)

In a custom managed API, you can use the following format for a query parameter:

Query key and value (`?param=value`)

Previously, query parameters were not displayed in the managed API endpoint URL, even when they were defined during the creation of the managed API.

For more information, see *Manage APIs*.

Distinct tabs for APIs and API groups while configuring OAuth 2.0 clients and defining user permissions for third-party authentication

When you configure an OAuth 2.0 client or third-party user permission, you'll now see the managed APIs and managed API groups categorized under the following tabs:

- Managed APIs
- Managed API Groups

With this enhancement, the APIs are now organized into distinct tabs, making it easier to locate and interact with the specific resources you need.

Previously, you could view both API types in a single, combined view requiring you to scroll to reach the next section. This made navigation inefficient and time-consuming.

For more information, see *Manage APIs*.

CHAPTER 5

May 2025

The May 2025 release of API Center includes the following updates.

New features and enhancements

The May 2025 release of API Center includes the following new features and enhancements.

Federated or third-party authorization server support with OAuth server 2.0

You can implement OAuth 2.0 authentication using federated or third-party providers such as, Okta and Azure AD, to secure your APIs effectively. This configuration enhances API security by leveraging external OAuth identity providers. You can streamline the authentication process, making it easier for developers to integrate secure access controls.

You can enable your API consumers to access protected resources using tokens generated from their preferred OAuth provider without pre-provisioning all API consumers through the IDMC identity provider.

For more information, see *API Policies*.

Custom SOAP API support

You can create, manage, and govern unique custom SOAP APIs that aren't based on Informatica service endpoints. The API URL that you specify must conform to the W3C standards.

For more information, see *Manage APIs*.

API groups and Managed API groups for SOAP and custom APIs

You can categorize published SOAP and custom APIs and their operations into logical API groups to easily manage the APIs in your organization. To create an API group, you must be assigned the Deployer or Admin role.

You can create subsequent managed API groups from an API group. You can add a URL context to a managed API group, create an IP filtering policy for a managed API group, and generate a JSON web token for a group of managed APIs. You can assign a rate limit policy to a managed API group.

For more information, see *Manage APIs*.

Changed behavior

The May 2025 release of API Center includes the following changed behavior.

Ability to edit API-level JSON web token of a managed API group

You can now add or remove an associated JSON web token authentication from a managed API group if the managed API group is in the created or inactive state.

Previously, after you created a managed API group that contained an API-level JSON web token, you couldn't add or remove the API-level JSON web token authentication. If you wanted to add or remove a JSON web token authentication, you had to create a new managed API group again.

Ability to edit the context of a managed API or a managed API group

You can now edit the context of a managed API or a managed API group if the managed API or the managed API group are in the created or inactive state.

Previously, you couldn't change the context of a managed API or a managed API group after you created it.

New keyword for vanity domain identifier

When you enable a vanity domain to personalize your API Center domain name and URL, you can now use `v~` and `api` as the vanity domain identifiers in the URL.

Previously, you used only `v~` as the vanity domain identifier in the URL.

Increase in API policy description length

You can now enter 512 characters in the **Description** field of all API Center policies.

Previously, you could enter only 255 characters in the `Description` field of all API Center policies.

Increase in API operation description length at design time

You can now enter 4000 characters for an API operation description when you create a REST API.

Previously, you could enter only 1025 characters for an API operation description.

CHAPTER 6

April 2025

The April 2025 release of API Center includes the following updates.

New features and enhancements

The April 2025 release of API Center includes the following new features and enhancements.

Real-time monitoring of APIs

You can gain real-time visibility into API health, including response times, latency, errors, and traffic. Additionally, you can access detailed analytics on API usage patterns, user behavior, and performance trends over time. You can use this data to optimize API operations, identify bottlenecks, and ensure compliance effectively.

API Center now provides various visual charts to help you.

For more information, see *Monitor APIs*.

Enhanced OAuth 2.0 support

You can now assign multiple managed APIs and managed API groups to a single OAuth 2.0 client. This improvement enhances API security and management by eliminating the need for multiple OAuth 2.0 clients. You can create a single OAuth 2.0 client to grant access to specific API sets, simplifying authorization control.

With this enhancement, disabling or deleting an OAuth 2.0 client will immediately invalidate its authorization token, preventing API access and enhancing security.

For more information, see *API Policies*.

Import of Application Integration processes to API Center

You can import all the Application Integration processes to API Center. The processes on the **Service Name** corresponds to the **API Name** and the **Source Name** corresponds to the **Name** in Application Integration.

This import capability helps you easily transition the REST APIs of published Application Integration processes into API Center. You can easily design, publish, and create managed APIs in API Center.

For more information, see *REST API Assets*.

Multibyte character support

You can use multibyte characters, including Japanese characters for the following API Center fields:

- Operation name

- API name
- Published API name
- Managed API name
- Policy name
- OAuth client 2.0
- Context
- API group name
- Managed API group name
- Custom API name
- Projects
- Application Integration process

For more information, see *Manage APIs*.

Date and Date Time data type support

When you define the request and response body of an API operation, you can select the Date and Date Time data types. You can also create an array type of the Date and Date Time data types.

Ability to edit operation policies in API groups

You can edit policies that are in created and inactive states of a Managed API group. Editing such policies enables you to reuse API groups with the same operations while applying different policies and context names.

You can reuse the same operation in multiple APIs with an API group but assign different policies and context names to the operations

You can also attach different policies to different operations when creating active managed API groups and hence ensures that you can reuse Published APIs directly from the API Console.

For more information, see *Manage APIs*.

API-level rate limit policy at operation level for API groups

If you associate an API-level rate limit policy with an API, but do not assign policies to individual API operations, the API-level rate limit policy is automatically applied to the operations when you add the published API operation to an API group. The active managed API groups will also enforce the applied rate limit.

This enhancement does not apply to the existing operations you previously added to a managed API group.

For more information, see *Manage APIs*.

Support for octet-stream content type

API Center now stores API responses that contain content types such as multipart/form-data and application/octet-stream. These new content types apply only when you include the file datatype in the request and response body fields during REST API creation.

Previously, API Center stored only application/json and XML content types.

For more information, see *REST API Assets*.

Array data type support in path and query parameters of an API operation

When you define the path and query parameters of an API operation, you can select the array type of the primitive data types. You can pass multiple values in the CSV format as default values for query parameters.

For more information, see *REST API Assets*.

Changed behavior

The April 2025 release of API Center includes the following changed behavior.

Automated domain provisioning

API Center now automatically provisions a domain with the default domain as `<organization ID.com>`. Automatic provisioning of a domain doesn't depend on your user role.

You can change the domain name on the **Domain Settings** tab on the **Configuration** page.

Previously, when you access API Center for the first time with the Admin or Deployer, you were prompted to select an API domain name and provision the domain. If the domain provisioning failed, you couldn't access API Center.

For more information, see *Introducing API Center*.

Support for multiple HTTP response codes

When you import an API definition with multiple response codes, you can view all the response codes on the **Response** tab of the operation panel. You can edit the response codes.

Previously, you could see only the one response code.

For more information, see *Introducing API Center*.

Conflict resolution during import of API definition

When you import an API definition with duplicate operation names, API Center adds the imported assets without replacing the existing assets. API Center doesn't show conflicts during import, but validates the unique endpoints when you publish the API.

Previously, when you imported a duplicate operation, the existing operation was replaced by the new operation.

For more information, see *REST API Assets*.

Synchronization of request and response between Application Integration and API Center

After you generate a new process in API Center and publish the API, the changes reflect in Application Integration. When you update the **Input Mapping** or **Output Mapping** fields in Application Integration and publish the process, the data synchronizes in API Center. Refresh the mapping in the process **Implementation** tab in API Center to view the synchronized data between Application Integration and API Center. The updates appear in the **Request** and **Response** tabs in API Center.

Previously, you updated and refreshed every field in API Center manually. Also, the **Transformation** section in the **Implementation** tab is removed as the data synchronizes automatically with each refresh.

For more information, see *REST API Assets*.
