NOTICES

This Informatica product (the "Software") includes certain drivers (the "DataDirect Drivers") from DataDirect Technologies, an operating company of Progress Software Corporation ("DataDirect") which are subject to the following terms and conditions:

1. THE DATADIRECT DRIVERS ARE PROVIDED "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT.
2. IN NO EVENT WILL DATADIRECT OR ITS THIRD PARTY SUPPLIERS BE LIABLE TO THE END-USER CUSTOMER FOR ANY DIRECT, INDIRECT, INCIDENTAL, SPECIAL, CONSEQUENTIAL OR OTHER DAMAGES ARISING OUT OF THE USE OF THE ODBC DRIVERS, WHETHER OR NOT INFORMED OF THE POSSIBILITIES OF DAMAGES IN ADVANCE. THESE LIMITATIONS APPLY TO ALL CAUSES OF ACTION, INCLUDING, WITHOUT LIMITATION, BREACH OF CONTRACT, BREACH OF WARRANTY, NEGLIGENCE, STRICT LIABILITY, MISREPRESENTATION AND OTHER TORTS.

Preface

Read the *Snowflake Cortex AI Connector Guide* to learn how to set up and use Snowflake Cortex AI connections. Use a Snowflake Cortex AI connection to leverage AI-powered features for advanced data processing in Snowflake.

CHAPTER 1

Introduction to Snowflake Cortex AI Connector

Use Snowflake Cortex AI Connector to enhance data processing capabilities by connecting Snowflake's cloud data platform with advanced AI and machine learning technologies. This connector enables organizations to leverage the vast data storage and analytics functionality of Snowflake while seamlessly incorporating AI-driven insights and automation.

Snowflake Cortex AI Connector provides the following key features:

- Connects Snowflake with Cortex AI to streamline data workflows, enabling advanced analytics and AI model execution within the Snowflake environment.
- Applies machine learning models to large datasets stored in Snowflake, driving business intelligence with actionable insights.
- Ensures efficient data processing and AI application execution, regardless of data volume.
- Customizes data and AI workflows to meet specific business needs, utilizing the connector’s flexibility to integrate various AI models.
- Optimizes query performance and data retrieval with the connector’s ability to efficiently handle complex AI operations.

Snowflake Cortex AI overview

Snowflake Cortex AI is a solution designed to elevate data analytics by integrating the capabilities of Snowflake's cloud data platform with advanced artificial intelligence and machine learning functionalities. This integration facilitates the development, deployment, and management of AI models directly within the Snowflake environment, allowing organizations to efficiently process and analyze their data while generating AI-driven insights.

Snowflake Cortex AI is designed to serve a wide range of industries, such as finance and banking, retail and e-commerce, healthcare, manufacturing, media and entertainment, and telecommunication.

CHAPTER 2

Snowflake Cortex AI connections

Snowflake Cortex AI Connector is an AI-powered connector that enables advanced data processing in Snowflake, offering capabilities, such as analysis, classification, translation, sentiment analysis, document parsing, summarization, and embedding creation.

You can also perform actions, such as complete inference, cortex analyst, cortex search, classify text, translate text, create embed text, sentiment analysis, summarize, extract an answer, parse document, cortex agent, and execute statement.

After you create a Snowflake Cortex AI connection, you can validate and save the connection.

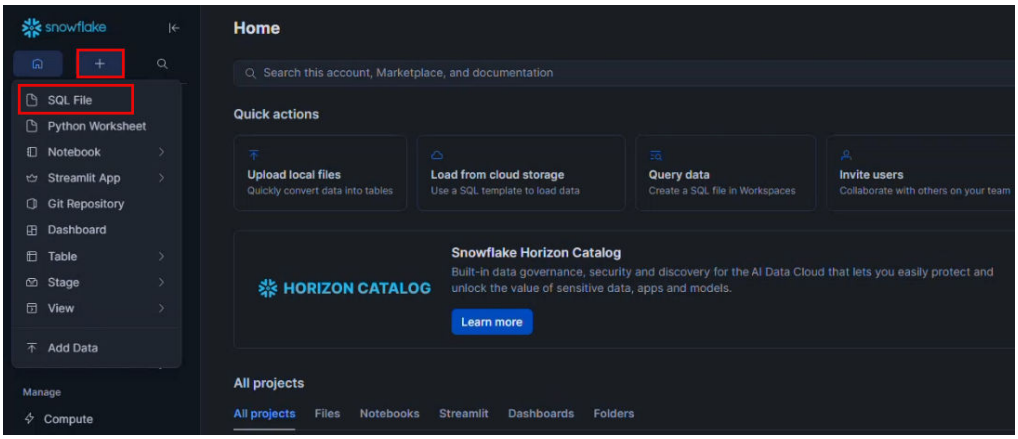

You can then publish the Snowflake Cortex AI connection and click the **Metadata** tab to view the generated process objects for the connection.

Prerequisites

You need the client ID and client secret to configure the Snowflake Cortex AI Connector using OAuth 2.0 authentication.

To retrieve the client ID and client secret, perform the following steps:

1. Log in to your Snowflake account using https://app.snowflake.com/<organization name>/<account name>/#/homepage.
2. Click **Add** > **SQL File** as shown in the following image:

3. To alter the user and set the sysadmin as the default user, run the following query :

```
alter user <username> set default_role = sysadmin;
```

4. To create the security integration, run the following query:

```
CREATE SECURITY INTEGRATION <integration_name>
  TYPE = OAUTH
  ENABLED = TRUE
  OAUTH_CLIENT = CUSTOM
  OAUTH_CLIENT_TYPE = 'CONFIDENTIAL'
  OAUTH_REDIRECT_URI = '<https://<your POD>/oauthcallback>'
  OAUTH_ISSUE_REFRESH_TOKENS = TRUE
  OAUTH_REFRESH_TOKEN_VALIDITY = 86400
  ;
```

   Note: The integration name must be in capital letters.

   For more information, see the Snowflake documentation.

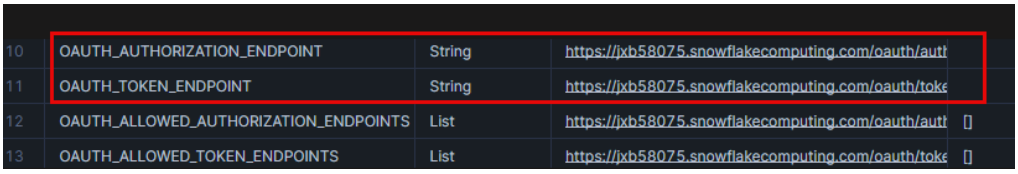

5. To grant all the permissions to sysadmin, run the following query:

```
GRANT ALL ON INTEGRATION <integration_name> to sysadmin;
```

6. To describe the security integration and retrieve the authorization URL and token request URL, run the following query:

```
DESCRIBE SECURITY INTEGRATION <integration_name>;
```

   Copy the authorization URL and token request URL as shown in the following image:

7. To retrieve the client credentials of the security integration, run the following query:

```
select system$show_oauth_client_secrets('<integration_name>');
```

Basic connection properties

The following table describes the basic properties that you can configure on the **Properties** tab of the connection creation page:

Property	Description
Name	Required. Unique name for the Snowflake Cortex AI connection that identifies it in the Process Designer. The name must start with an alphabet and can contain only alphabets, numbers, and hyphens (-).
Location	The location of the project or folder where you want to save the connection. Click **Browse** to select a location. If the **Explore** page is currently active and a project or folder is selected, the default location for the connection is the selected project or folder. Otherwise, the default location is the location of the most recently saved asset.
Description	Optional. Description of the connection.
Type	Required. The type of connection you want to use for the connector or service connector. Select **Snowflake Cortex AI**.

Property	Description
Runtime Environment	Required. The runtime environment for the connection. You can run the connection on the Cloud Server, a Secure Agent group, or a Secure Agent machine.
Connection Test	Not supported for Snowflake Cortex AI Connector.
OData-Enabled	Not supported for Snowflake Cortex AI Connector.

After you configure the basic properties, you can define the OAuth 2.0 authentication properties for the Snowflake Cortex AI connection.

Snowflake Cortex AI connection authentication properties

When you create a Snowflake Cortex AI connection, you can configure the connection using OAuth 2.0 authentication properties.

To authenticate the Snowflake Cortex AI connection using OAuth 2.0 authentication, select **OAuth2** in the **Authentication Type** list and configure the following properties:

Property	Description
Grant Type	Required. Select the required grant type based on your use case.
Authorization URL	Required. Enter the OAuth authorization URL for the OAuth provider to authorize the user request. For example: `https://<account_name>.snowflakecomputing.com/oauth/authorize`
Token Request URL	Required. Enter the OAuth token request URL that handles token requests. For example: `https://<account_name>.snowflakecomputing.com/oauth/token-request` The expiration of the refresh token depends on the OAuth provider. You must re-authenticate and publish the connection before the token expires. **Note:** The refresh token doesn't apply to agents and agent groups.
Client ID	Required. Specify the identifier value from the OAuth provider that you copied after creating the security integration.
Client Secret	Required. Enter the client secret to connect to the OAuth provider that you copied after creating the security integration.
Scope	Required. Specify the scope as `refresh_token`.
Authorization Status	Indicates the current status, the name of the user who authorized, and the last time when the authorization was completed.
Authorize Access	Click to initiate the authorization workflow using OAuth. Enter the user name and password for Snowflake, if prompted.

Snowflake Cortex AI connection properties

To configure the Snowflake Cortex AI connection, enter the account identifier in the **Account_Identifier** property within the **Connection Properties** section. This identifier is used to used to access the Snowflake account.

To find your account identifier, run the following query in Snowflake Web UI:

```
SELECT CURRENT_ORGANIZATION_NAME() || '-' || CURRENT_ACCOUNT_NAME();
```

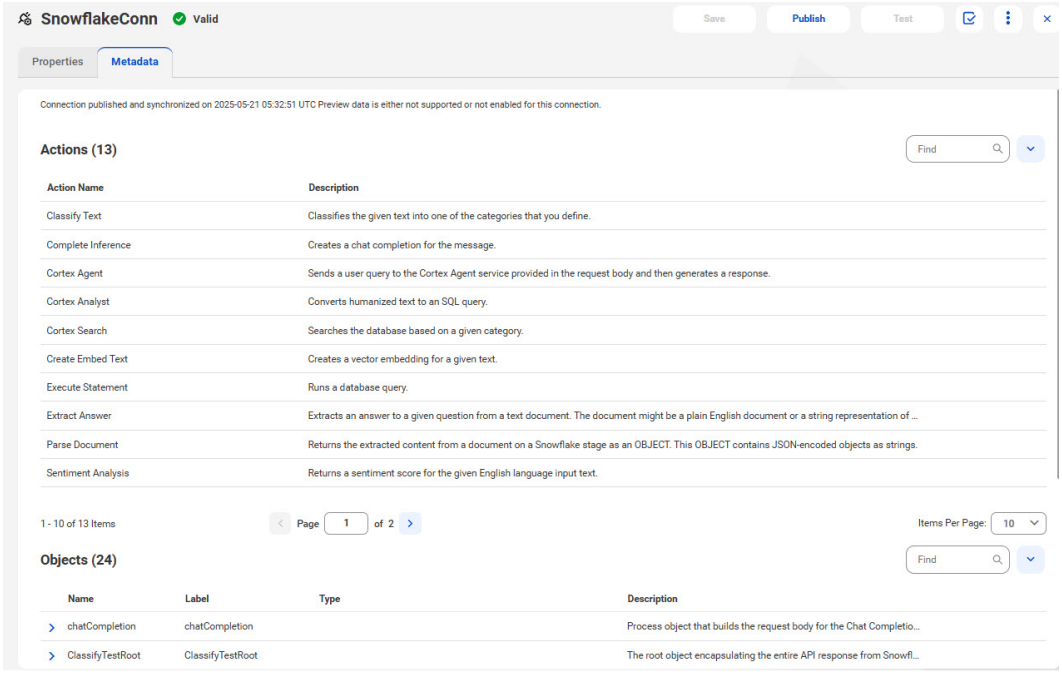

The account identifier must not contain underscores (_). If underscores (_) are present, you must replace them with hyphens (-).

Snowflake Cortex AI connection metadata

After you create a Snowflake Cortex AI connection, you can validate and save the connection. You can then publish the Snowflake Cortex AI connection and click the **Metadata** tab to view the generated process objects for the connection.

When you publish a Snowflake Cortex AI connection in Application Integration, the **Actions** and **Objects** appear on the **Metadata** tab.

The following image shows the **Metadata** tab for a published Snowflake Cortex AI connection:

Snowflake Cortex AI connection actions and objects

When you publish a Snowflake Cortex AI connection in Application Integration, the **Actions** and **Objects** appear on the **Metadata** tab.

Consider the following information when you use specific actions and objects:

- The **Complete Inference** action creates a chat completion for the message.
  Enter the following input field values as a sample request:

  - model: mistral -large

  - messages: hi

  - top_p: 1 (default)

  - temperature: 0 (default)

  - max_tokens: 4096 (default)

  The following snippet is a sample response:

```

</result>
```

The following snippet is a sample extracted response:

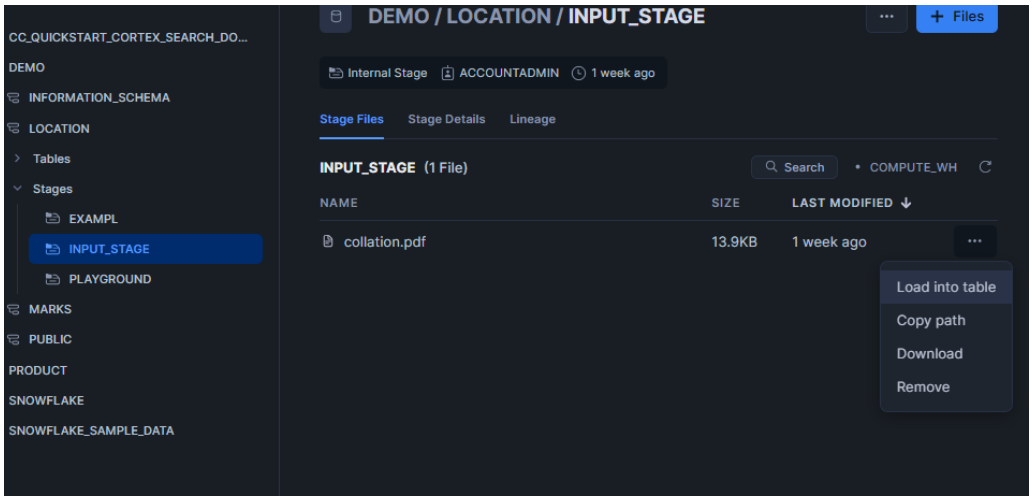

```
Hello! How can I assist you today?
```

- The **Cortex Analyst** action converts humanized text into an SQL query.
  You must provide the input fields, such as message role, message content type, message content text, and path to the semantic model file. For example, @DEMO.MARKS.MARKS/mark.yaml

  Semantic model path can be obtained from **Databases** > **Required database** > **Required schema** > **Required stage**. The list of YAML files appears. You can copy the file path of the required YAML file.

  You can create a YAML file in Snowflake web UI using AI & ML studio.

  The following image shows the YAML file to copy:

Note: You can pass only the path of the YAML file.

Enter the following input field values as a sample request:

- messages.role: user

- messages.content.type: text

- messages.content.text: give me the average marks of students?

- semantic_model_file: @DEMO.MARKS.MARKS/marks.yaml

The following snippet is a sample response:

```

```

The following snippet is a sample extracted response:

```
SELECT AVG(math_mark) AS avg_math, AVG(tel_mark) AS avg_telugu, AVG(hin_mark) AS
avg_hindi, AVG(eng_mark) AS avg_english, AVG(phy_mark) AS avg_physics, AVG(soc_mark)
AS avg_social FROM __marks
```

- The **Cortex Search** action searches the database based on a given category.
  Enter the following input field values as a sample request:

  - database: PRODUCT

  - schema: SALES

  - service_name: exampl

  - queries: Personal Care

  - columns: name,price,review,category

  - limit: 5

  - filters:

  The following snippet is a sample response:

The following snippet is a sample extracted response:

```
39.99-A luxurious perfume.-Perfume-Gifts, 6.99-Keeps your hands soft and moisturized.-
Hand Lotion-Cosmetics, 7.99-Cleans and nourishes your hair.-Shampoo-Personal Care,
4.99-Protects and whitens your teeth.-Toothpaste-Personal Care, Cleans and
moisturizes your skin.-2.99-Soap-Personal Care
```

- The **Classify Text** action classifies the given text into one of the categories that you define.
  Enter the following input field values as a sample request:

  - input: One day, I will see the world

  - label1: cooking

  - label2: travel

  The following snippet is a sample response:

  ```
  {
    "label": "travel"
  }
  ```

- The **Translate Text** action translates the given input text from one supported language to another.
  Enter the following input field values as a sample request:

  - text: Hello,how are you?

  - source_langauge: en

  - target_language: fr

  The following snippet is a sample response:

  ```
  Bonjour, comment allez-vous ?
  ```

- The **Create Embed Text** action creates a vector embedding for a given text.
  Enter the following input field values as a sample request:

  - type: 768

  - model_for_1024: snowflake-arctic-embed-l-v2.0

  - text: hello world

  - model_for_768: snowflake-arctic-embed-m-v1.5

  The following snippet is a sample response:

- The **Sentiment Analysis** action returns a sentiment score for the given English language input text. Enter the following input field value as a sample request:

  - text: I love using Snowflake, it's simple and easy

  The following snippet is a sample response:

  ```
  0.8380476
  ```

- The **Summarize** action summarizes the given English-language input text.
  The following snippet as a sample request:

  ```
  Informatica is a leading company in the field of enterprise cloud data management, offering a range of software solution's designed to help organizations effectively manage and integrate their data. Their tools and platforms, such as PowerCenter and Cloud Data, provide functionalities for data integration, profiling, and cleaning, which are essential for ensuring data quality and governance. By leveraging these solutions, businesses can enhance their data management processes, maintain compliance, and facilitate seamless data integration across various systems. Informatica's offerings empower organizations to drive their digital transformation initiatives, enabling them to make informed decisions and stay competitive in a data-driven world.
  ```

  The following snippet is a sample response:

  ```
  Informatica is a leading enterprise cloud data management company, providing software solutions for effective data management and integration. Their offerings include PowerCenter and Cloud Data for data integration, profiling, and cleaning, ensuring data quality and governance. Businesses use these tools to enhance data management processes, maintain compliance, and facilitate seamless data integration. Informatica's solutions enable digital transformation, enabling informed decision-making and competitiveness in a data-driven world.
  ```

- The **Extract Answer** action extracts an answer to a given question from a text document. The document might be a plain English document or a string representation of a semi-structured JSON data object.
  Enter the following input field values as a sample request:

  - source_document: Apple is a fruit which is nutritious and healthy. Banana is a fruit which is good for our health. Orange's are rich in Vitamin C, which is essential for immune function. Strawberries are high in antioxidants, promoting heart health and skin beauty. Grapes are packed with vitamins and minerals, aiding in healthy blood circulation. Mangoes are a source of Vitamin A, supporting eye health. Pineapples contain enzymes that aid digestion and reduce inflammation. Watermelons are hydrating and help in maintaining skin health.
  - question: What is pineapple?

  The following snippet is a sample response:

  ```
  [
    {
      "answer": "contain enzymes that aid digestion and reduce inflammation",
      "score": 0.9908955
    }
  ]
  ```

- The **Parse Document** action returns the extracted content from a document at a Snowflake stage as an OBJECT. This OBJECT contains JSON-encoded objects as strings.
  While creating the stage, you must enable Snowflake server-side encryption. You must use the following query to enable Snowflake server-side encryption:

  ```
  CREATE STAGE <name> DIRECTORY = ( ENABLE = true ) ENCRYPTION = ( TYPE = 'SNOWFLAKE_SSE' );
  ```

  To add a document to stage, you must use the following query in the terminal window:

  ```
  snowsql -a <your accountIdentifier> -u <username> -d<database> -s <schema>
  ```

  Enter the password. After that use the following PUT command to add the file in the Snowflake stage:

  ```
  PUT 'file:path' @stage AUTO_COMPRESS = FALSE;
  ```

  Note: Ensure that you use `AUTO_COMPRESS = FALSE`. Otherwise, the file will be compressed.

  Enter the following input field values as a sample request:

  - stage: @DEMO.LOCATION.input_stage
  - path: collation.pdf
  - mode: OCR

The following snippet is a sample response:

```
{
  "content": "SnowFlake - Collate --> to combine we generally use where join,
aggregate functions, order by, limit and offset, group by, window functions,\nscalar
functions, clustering keys and clustered tables Collation defines how strings are
compared, ordered, and stored based on certain\ncharacteristics. it defines rules
for: 1.Case Sensitivity: Whether the uppercase and lowercase alphabets are considered
as same 2.Accent\nSensitivity: whether the character like different accent are same
or not 3.Locale: Different languages have different sorting and comparison\nvalues
4.Character Sorting: Defines the order of character in string comparison Types of
collation in snowflake: 1.Binary Collation:(BINARY)\nThis is default collation, this
is case-Sensitive and accent-senstive and character are compared based on its binary
value(ASCII). 2.Case-\nInsensitive Collation:(CI) This ignores case sensitivity, it
can be used where scenarios where case does not matter in string
comparisons.\n3.Accent-Insensitive Collation:(AI) This ignores the accents, it's
useful in scenarios where accents should not affect comparisons. 4.Case-\ninsensitive
and Accent-Insensitive:(CI_AI) This ignores both case and accent, used in many multi-
lingual scenarios where neither case nor\naccents should affect string matching
5.Locale-Specific Collations: It also supports locale-specific collations(eg.,en_US
for English(united\nstates), fr_FR for French(france)) 6.Punctuation-Insensitivity:
(PI) This ignore the punctuation that are used in the given string(i.e A-B-C and ABC
\nboth are equal) Using COLLATE in Snowflake: It can be used in two primary ways:
1.On Columns when creating or Altering Table: example:\nCREATE TABLE users( username
VARCHAR COLLATE 'en_US', email VARCHAR COLLATE 'ci' ); to modify the collate property
we can use: ALTER\nTABLE users MODIFY COLUMN email SET COLLATION 'AI'; 2.On specific
String Operations: example: SELECT * FROM users WHERE username =\n'john' COLLATE
'ci'; the output will be the name of john as JOHN or John or john we can also use the
collation with ORDER BY SELECT * FROM\nusers ORDER BY username COLLATE 'fr_FR';",
  "metadata": {
    "pageCount": 1
  }
}
```

- The **Cortex Agent** action sends a user query to the Cortex Agent service provided in the request body and then generates a response.
  Enter the following input field values as a sample request:

  - model: llama3.1-70b

  - prompt: give me the products whose catgeory is personal care

  - search_service_name: PRODUCT.SALES.EXAMPLE

  - semantic_model: @PRODUCT.SALES.PRODUCT/product.yaml

  - tool_specs: cortex_search:transcript_search,cortex_analyst_text_to_sql:data_model

  - type: text

  - queries: Personal care

  - columns: name

  - filter:

  - max_results: 4

```

- The **Structured Output** generates structured output in a specified format.
  Enter the following input field value as a sample request:

```
model: mistral -large
messages: <messages>
<content>You are a planning agent as part of a supply chain copilot system in a
computer hardware company for data centers. Your task is to analyze the user's input,
determine the necessary steps to answer their question, and identify which data from
the available systems is required for each step. Some user prompts require multiple
systems, and your response should include all the systems included from the available
```

```
systems. Always adhere to the responses in the JSON format as prescribed below.

Here is the list of available systems along with the information contained in each
system:
*   CDGC (Informatica Cloud Data Governance System): Contains metadata information
about custom data models, including field or column names, data quality score, and
business glossary explaining the business terms. ALWAYS ADD cdgc in planner output
when orcl data is requested as cdgc contains the metadata for the oracle tables.
*   Salesforce: Contains order information for computer hardware in the schema of the
Salesforce order object with all standard fields without the order line items. Orders
where the status is draft mean that the orders are pending review. The order details
include order ID, product ordered, quantity ordered, order status, customer account
name, and the date the order was created.
*   MDM (Informatica MDM): Contains information across three different domains:
products, the different components or parts for each product, and the supplier
details for each component or part.
*   ORCL: This is the Oracle database. Always include cdgc whenever orcl is present
as a planning step as the metadata for oracle is contained in cdgc. Oracle database
contains details of supplier performance with regards to delivery times for each
component based on the airport of delivery. The airport codes are also available only
through the Oracle database. When constructing the filter condition, only include
component_id and supplier_name if relevant and nothing else. Make sure to execute
cdgc before orcl to retrieve the oracle table names.
*   TRR (Transportation Risk Report): Contains airport codes along with the current
risk profile (low, medium, and high) and the current risk situation for the
components to be delivered by the supplier using the airport for delivery from
supplier performance analysis. So, supplier performance analysis information is
needed before retrieving the data from the transportation risk report. Always execute
orcl before executing trr.</content>
<role>system</role>
</messages>
<messages>
<content>You will be provided with a user prompt and conversation history.

User Prompt: Show me orders pending review

Conversation History:

To complete this task, follow these steps:

1.  Analyze the available systems.
2.  Validate the user prompt based on the criteria specified in the validation
criteria. If the user prompt is very broad, do not proceed. The user input must have
information that systems can provide. Add a question in the 'aiask' field of the JSON
if the prompt is too broad.

    Validation Criteria:

    *   User prompt should be specific to the supply chain and production scenario.
    *   User prompt should not be broad and generic and should not have the use of
superlative terms like best order, highest price, lowest price, significant, worst
laptop, cheaper laptop.
    *   User questions will contain the conversation history. Use the conversation
history data while responding.

    Sample list of allowed questions:

    *   Give order details
    *   Get order details for orders pending review
    *   Want to see order details for all orders
    *   Show product details
    *   What are the details for a product with a GPU?
    *   Show me supplier details for a product
    *   Do you have supplier details for the component?
    *   Who are the suppliers for the different components for the product?
    *   What is the ID for a product, supplier, or component with a name?
    *   What is the supplier lead time for the supplier?
    *   Show me alternate suppliers for the component along with lead times
    *   Show the low-risk option for delivery or transportation
    *   What is the delivery risk for the airport?
    *   Show me orders that need a review and show me product details
```

```
    *   Give me orders that need a review and product details for the order
    *   Show me the risk from pending orders and its suppliers?
3.  Extract key information from the conversation history specified in the JSON
element conversation\_history.
4.  Reconstruct the user prompt based on the extracted information, especially from
"aiask" and "User Question" in the previous conversation from conversation\_history.
5.  Ensure the conditions within the prerequisites are met. If the conditions are not
met, do not proceed and add only the information needed as a question within the
'aiask' field of the JSON response and be polite.

    Prerequisites:

    *   For orders, if nothing is specified, fetch all the records.
    *   For products, please ensure that product identity or product name is
available.
    *   For component or part details, please ensure one of the following
information: product identity or product name, component identity or component name
is available.
    *   For supplier details, please ensure that one of the following information:
product identity, product name, component identity, component name, supplier ID, or
supplier name is available.
    *   For supplier lead time details, please ensure that component identity,
component name, supplier ID, or supplier name is available.
    *   For transportation or delivery risk, please ensure that component identity,
component name, supplier ID, supplier name, or airport code is available.
6.  Identify which system(s) contain the required data.
7.  Create a step-by-step plan in the JSON format to retrieve the associated
metadata, if mentioned in the systems, and the information from each system.
8.  Always include CDGC when ORCL information is requested. CDGC should come before
ORCL. If CDGC is present in the output, keep CDGC before ORCL and after Salesforce
and MDM.

    Planner Optimization Paths:

    *   optimal\_path\_1: If both product and supplier details are requested, reduce
the number of steps in the planner as both the product and supplier information can
be queried in a single step.
    *   optimal\_path\_2: By default, the planner should retrieve the metadata for
the most recently modified object from the CDGC system, then use this supplier
information to get the lead times from the ORCL system. Only if the request specifies
aggregate data quality, first retrieve the metadata for the object with the highest
data quality from the CDGC system, then use this supplier information to fetch lead
times from the ORCL system.
    *   optimal\_path\_3: Here are the guidelines for generating filter conditions
for the ORCL system.

        1.  If the filter condition requires order details, add a step to the planner
output to obtain it from Salesforce.
        2.  If the filter condition requires product details, component details, or
supplier details, must add a step to the planner output to obtain product details,
component details, or supplier details from MDM.
        3.  Always add a step to the planner to retrieve column names, table names
necessary information from CDGC.
        4.  Ensure the filter condition only includes component\_id, component\_name,
supplier\_id, and supplier\_name. No other columns are allowed.
        5.  The filter condition must not contain any SQL JOIN statements or
subqueries. It should only contain SQL WHERE clause conditions. It should not contain
any SQL SELECT statement or queries.
        6.  Avoid creating or referencing any database tables or columns outside of
metadata information in the CDGC system.
    *   optimal\_path\_4: The table name for ORCL can be inferred from the object
name in the CDGC metadata. If present, you can extract the object name from the
conversation\_history in CDGC metadata.
9.  Provide your final output in the JSON format as specified below. Ensure that your
plan is comprehensive, logical, and directly addresses the user's input. Each step
should be clear and actionable, with a specific description of the required data and
the system it comes from. Explain the reasoning step-by-step within the 'reasoning'
field of the JSON schema as one paragraph. The output should only contain the JSON
adhering to the schema below. Always adhere to the JSON format for responses even
when you are not able to retrieve the corresponding data.
```

```
    JSON Output Format:

    {
      "reasoning": "The user is requesting information about orders that need review.
Based on the available systems, this information can be found in the Salesforce
system. Specifically, we need to query the order object in Salesforce and filter for
orders with a 'draft' status, as these are the orders pending review according to the
system description. This query will provide the necessary order details for review.",
      "aiask": null,
      "Planner": [

```

The following snippet is a sample extracted response:

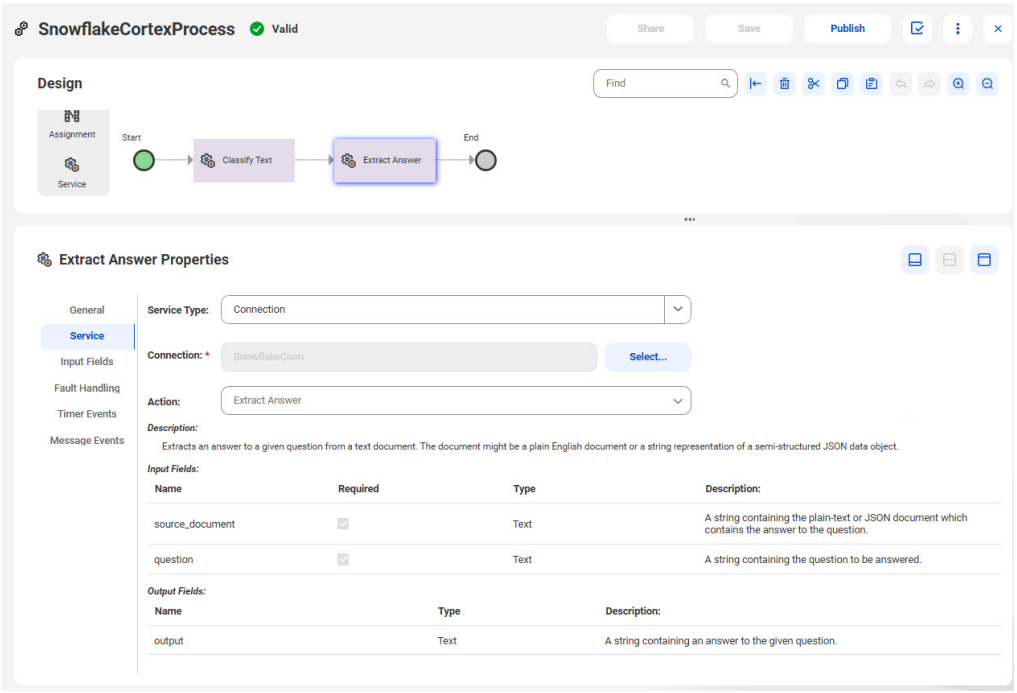

```
{
  "reasoning": "The user is requesting information about orders that need review.
Based on the available systems, this information can be found in the Salesforce
system. Specifically, we need to query the order object in Salesforce and filter for
orders with a 'draft' status, as these are the orders pending review according to the
system description. This query will provide the necessary order details for review.",
  "aiask": null,
  "Planner": [
    {
      "app": "salesforce",
      "action": "query",
      "object": "order",
      "filter": "status = 'draft'",
      "prompt_selector": "Get orders with status"
    }
  ]
}
```

Using a Snowflake Cortex AI connection in a process

After you create a Snowflake Cortex AI connection, you can use it in a Service step in a process.

1. Add a Service step to the process.

2. Click the **Service** tab.
3. From the **Service Type** list, select **Connection**.
4. From the **Connection** list, browse and select the Snowflake Cortex AI connection that you created.
5. From the **Action** list, select the action that you want to perform. For example, select the **Extract Answer** action to extract an answer to a given question from a text document as shown in the following image:

In this case, Application Integration populates the **source_document** and **question** objects under the input fields and the **output** object under the output fields.

6. Configure further steps as needed.
7. Validate, save, and publish the process.
