Entering an Adabas FDT Password for CAPXRT Database Row Tests or PowerCenter CDC Sessions

© Copyright Informatica LLC 2011, 2021. Informatica

Abstract

This article shows how to enter the Adabas FDT password when you connect to an Adabas source or target during a PowerCenter batch, Change, or Real-time mode session or run a CAPXRT database row test for an Adabas extraction map.

Supported Versions

- PowerCenter 10.0 or later
- PowerExchange 10.0 or later

Entering an Adabas FDT Password for a CAPXRT Database Row Test. 2

Adabas FDT Password Overview

If the Adabas field definition table (FDT) for an Adabas source or target is password-protected, you must enter the password to connect to the Adabas source or target during a PowerCenter CDC session. Also, you must enter the password to run a CAPXRT database row test against an extraction map for the Adabas source file.

PowerExchange requires the Adabas FDT password to access Adabas data for these functions.

Entering an Adabas FDT Password for a PowerCenter CDC Session

When you configure a Change or Real-time mode session for an Adabas extraction map source or configure a batch mode session for an Adabas nonrelational source, enter the Adabas FDT password in the **ADABAS Password** field of the session properties.

For more information about configuring PowerCenter sessions, see the *PowerExchange Bulk Data Movement Guide* and *PowerExchange Interfaces for PowerCenter*.

Entering an Adabas FDT Password for a CAPXRT Database Row Test

If the Adabas FDT for an Adabas CDC source file is password-protected, you must enter the password to run a CAPXRT database row test for an Adabas extraction map.

When you run a CAPXRT database row test for an Adabas extraction map in the PowerExchange Navigator, click **Advanced** to access the **CAPXRT Advanced Parameters** dialog box. Then, enter the Adabas FDT password in the **ADABAS File Password** field.
For more information about running database row tests, see the *PowerExchange Navigator User Guide*.
