Preface

Use *CLAIRE Copilot for Multidomain MDM SaaS* to learn how to use natural language prompts to find and view records in Multidomain MDM SaaS. You can also learn how to explore, view, and understand the metadata of a business entity.

Informatica Resources

Informatica provides you with a range of product resources through the Informatica Network and other online portals. Use the resources to get the most from your Informatica products and solutions and to learn from other Informatica users and subject matter experts.

Informatica Documentation

Use the Informatica Documentation Portal to explore an extensive library of documentation for current and recent product releases. To explore the Documentation Portal, visit https://docs.informatica.com.

If you have questions, comments, or ideas about the product documentation, contact the Informatica Documentation team at infa_documentation@informatica.com.

IDMC web site

You can access the Informatica® Intelligent Data Management Cloud™ (IDMC) web site at http://www.informatica.com/cloud.

Intelligent Data Management Cloud Communities

Use the IDMC Community to discuss and resolve technical issues. You can also find technical tips, documentation updates, and answers to frequently asked questions.

To access the IDMC Community, see Master Data Management SaaS Community.

Developers can learn more and share tips at the Cloud Developer community:

https://network.informatica.com/community/informatica-network/products/cloud-integration/cloud-developers

IDMC Marketplace

Visit the Informatica Marketplace to try and buy Data Integration Connectors, templates, and mapplets:

https://marketplace.informatica.com/

Informatica Knowledge Base

Use the Informatica Knowledge Base to find product resources such as how-to articles, best practices, video tutorials, and answers to frequently asked questions.

To search the Knowledge Base, visit https://search.informatica.com. If you have questions, comments, or ideas about the Knowledge Base, contact the Informatica Knowledge Base team at KB_Feedback@informatica.com.

IDMC Trust Center

The IDMC Trust Center provides information about Informatica security, compliance, and privacy practices.

You can access the trust center at https://trust.informatica.com/.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the IDMC Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.

CHAPTER 1

Getting started with CLAIRE Copilot

CLAIRE Copilot is a conversational user interface that you can use to create and understand assets in your organization using natural language prompts.

CLAIRE Copilot is available for the following services:

- Application Integration
- Data Integration
- Data Ingestion and Replication
- Customer 360 SaaS
- Product 360 SaaS
- Supplier 360 SaaS
- Multidomain MDM SaaS

CLAIRE Copilot features

CLAIRE Copilot integrates with MDM SaaS to help you discover business entities, explore metadata of business entities, and explore records in business entities.

The following table describes the MDM SaaS tasks that you can perform using CLAIRE Copilot:

Task	Description
Data discovery	Start conversations to quickly search and discover business entities from Multidomain MDM SaaS. For more information about data discovery, see *Discovery Agent* in Data Management Agents.
Metadata exploration	Explore, view, and understand the metadata attributes of a business entity in Multidomain MDM SaaS. The metadata exploration includes details, such as business entity overview, searchable attributes, match rules, data quality rules, and survivorship rules. For more information about metadata exploration, see *Discovery Agent* in Data Management Agents.
Data exploration	Explore records by using field values as search criteria and then download sample data from Multidomain MDM SaaS. For more information about data exploration, see *Discovery Agent* in Data Management Agents.

CLAIRE Copilot can answer questions about information available in the Informatica documentation portal, Knowledge Base articles, and How-To Library article.

CLAIRE Copilot can't help you with other tasks that aren't listed here.

Enable CLAIRE generative AI services

As an organization administrator, you need to authorize users of your organization to utilize Informatica's CLAIRE services either by enabling CLAIRE generative AI services in Administrator or by providing consent to use CLAIRE services in CLAIRE Copilot.

You can enable CLAIRE generative AI services for your organization in one of the following ways:

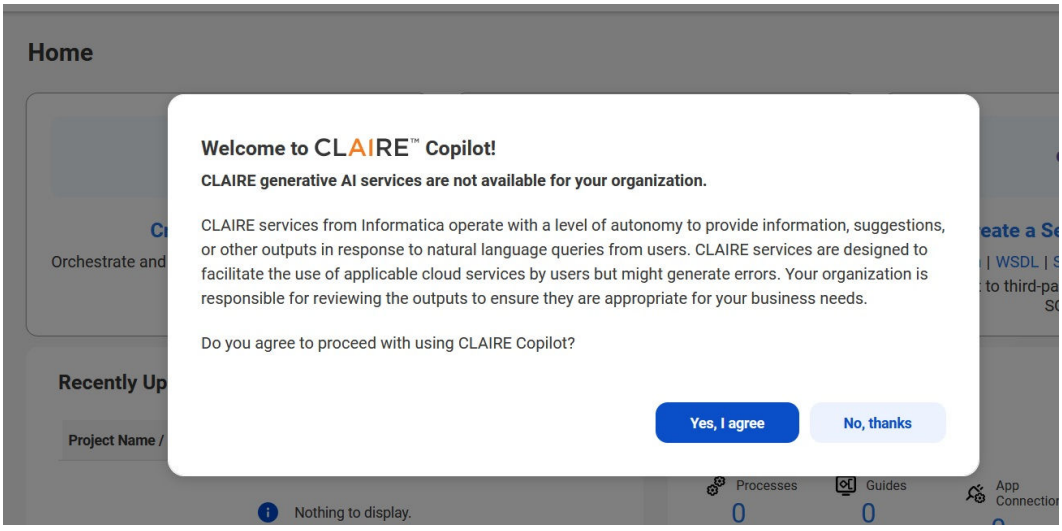

- In Administrator > **Settings**, select **Enable CLAIRE Generative AI Services**.
- Click **Yes, I agree** on the **Welcome to CLAIRE Copilot!** dialog box in your service.

  Note: After you give consent to use CLAIRE services, the **Enable CLAIRE Generative AI Services** check box in Administrator appears enabled.

After you enable CLAIRE generative AI services, tasks run in the background to make CLAIRE available for all users in your organization, and this could take several minutes to complete. You can continue to use other services during this time.

CLAIRE services from Informatica operate with a level of autonomy to provide information, suggestions, or other outputs in response to natural language queries from users. CLAIRE services are designed to facilitate the use of applicable cloud services by users but might generate errors. Your organization is responsible for reviewing the outputs to ensure they are appropriate for your business needs.

The following image shows the consent dialog box in CLAIRE Copilot:

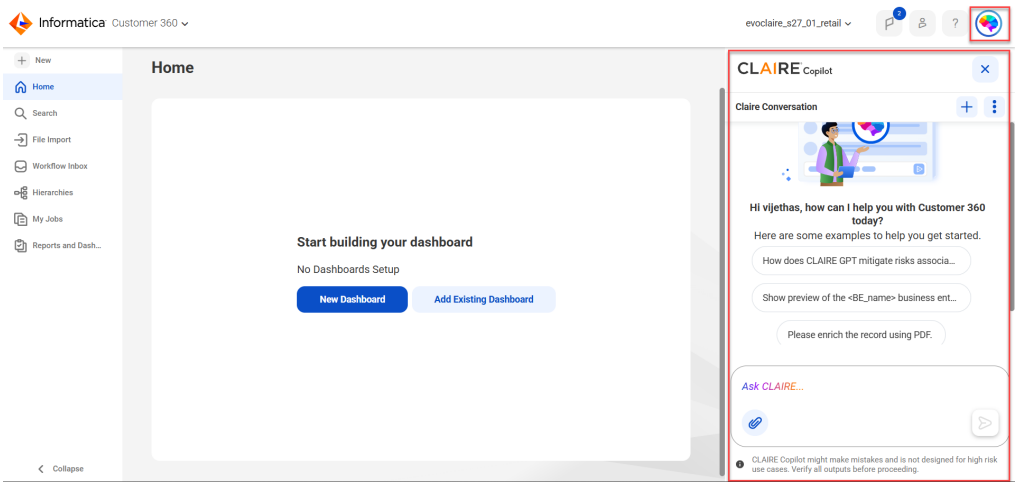

For more information about how to enable CLAIRE generative AI services in Administrator, see *Organization Administration* in Administrator.

Open CLAIRE Copilot and start a conversation

Open CLAIRE Copilot from the **Home** page of your service. When you open CLAIRE Copilot, a conversation window appears where you can start or continue a conversation.

1. On the **Home** page of your service, select the CLAIRE Copilot icon to open the conversation window.

   The following image shows the CLAIRE Copilot icon and the conversation window:

2. Select one of the sample prompts, or type your own prompt in the prompt text box.

   Optionally, hover over the keyboard shortcuts to help you write a prompt.

3. Submit the prompt and wait for CLAIRE Copilot to return a response.

   To cancel a prompt, select **Stop generating response** before CLAIRE Copilot displays the response.

Ask questions about the Informatica help

CLAIRE Copilot can answer questions about IDMC on the Informatica Documentation Portal, in Knowledge Base articles, and in How-To Library articles.

CLAIRE Copilot has access to the following documentation:

- Informatica Documentation Portal
- Knowledge Base articles
- How-To Library articles

You can ask CLAIRE Copilot questions about the functionality that's available in IDMC, how to create assets, how to resolve errors, and best practices. You can also ask CLAIRE Copilot about its own capabilities.

For example, you can ask the following question:

```
What can CLAIRE Copilot do today in Master Data Management?
```

Use the following guidelines to improve responses:

Provide context for the question.

Provide the the context, details, and service name for CLAIRE Copilot to understand how and where it can find the answer to your question in the Informatica help.

For example, the following questions specify the service name:

```
How to manage hierarchical relationships for customers in Customer 360?
```

Rephrase the question.

CLAIRE Copilot answers questions based on the information that's available in the Informatica help. If CLAIRE Copilot doesn't return the answer you expected, try rephrasing the question or using terminology from the Informatica help.

For example, if CLAIRE Copilot doesn't understand `basic summary`, try `brief summary`.

Leave feedback

We welcome feedback on your experience with CLAIRE Copilot. You can use the **Like** and **Dislike** icons to rate responses. To provide more details, select **Add Comments** or send an email to `copilot-feedback@informatica.com`.

If you need to report an issue, you can copy the conversation ID from the **Actions** menu of the conversation window. Include the conversation ID in the issue.

Informatica carefully reviews your feedback and uses it to improve CLAIRE Copilot for everyone.

Clear conversation memory

CLAIRE Copilot remembers the prompts and responses during your conversation so it can help you continue working on the same asset.

If you don't want CLAIRE Copilot to refer to information in previous prompts and responses, you can clear the conversation memory. For example, you might want to clear the conversation memory if you want to start working on a new asset.

You can clear the conversation memory in one of the following ways:

- Start a new conversation. To start a new conversation, click the **Plus** icon. CLAIRE Copilot clears its memory and resets the conversation window.
- Enter the prompt `Start Over`. CLAIRE Copilot clears its memory but you can still see the previous conversation in the conversation window.

CHAPTER 2

Discover assets

Quickly search and discover business entities in Multidomain MDM SaaS with CLAIRE Copilot.

When you use data discovery to find assets in Multidomain MDM SaaS, CLAIRE Copilot returns the available business entities but doesn't return reference data sets.

CLAIRE Copilot lists all business entities in Multidomain MDM SaaS and a few prompt suggestions. You can click the suggested prompts to analyze deeper.

You can rapidly identify business entities and perform metadata and data exploration using simple natural language prompts.

Data discovery prerequisites

Before you perform data discovery tasks in CLAIRE Copilot for MDM SaaS, ensure that you perform the following tasks:

- Enable the MDM SaaS service for the runtime environment that your organization uses.
- Verify that business entities are available in MDM SaaS.
- Upgrade Customer 360 SaaS, Product 360 SaaS, and Supplier 360 SaaS to the latest version.

Data discovery sample prompts

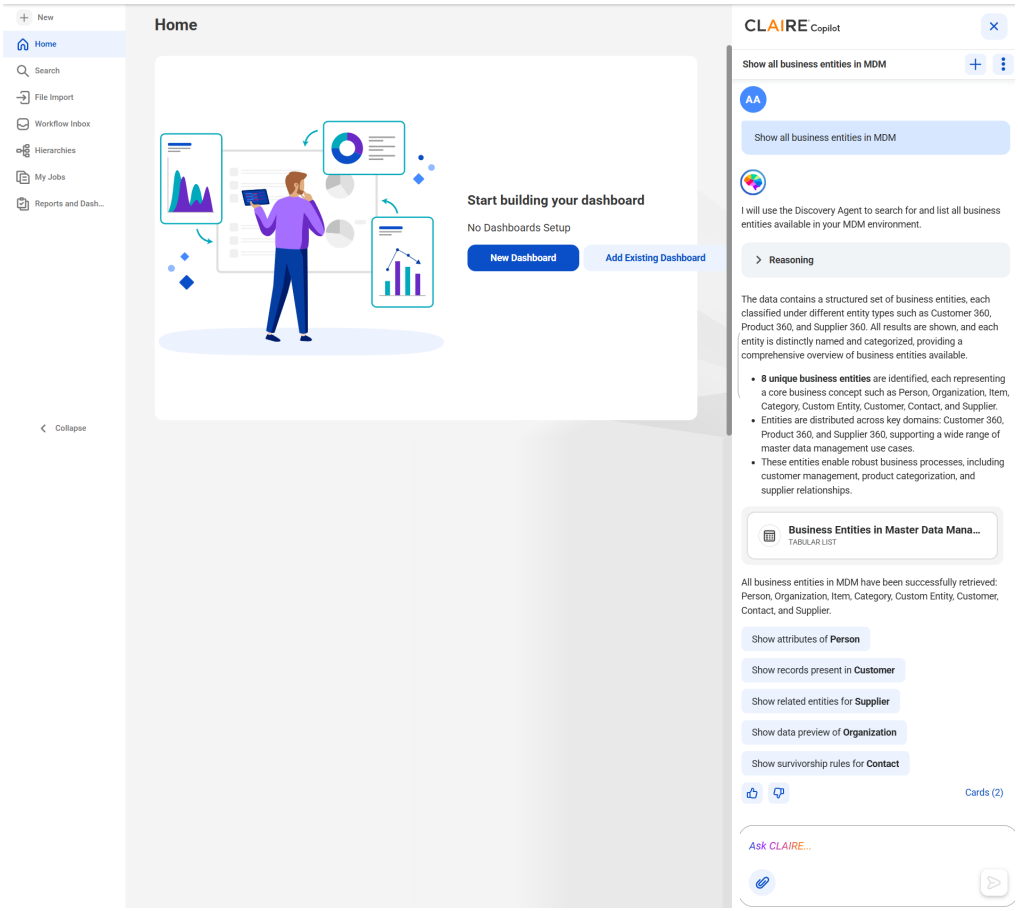

Let's take a look at a sample conversation to help you get started on your Multidomain MDM SaaS data discovery journey in CLAIRE Copilot.

Your organization uses MDM SaaS to store customer, product, and supplier records. As a data steward, you want to discover all business entities in MDM SaaS and then discover business entities in Multidomain MDM SaaS to identify customer data that you can use in your analysis.

1. Start a conversation to help you discover all business entities in MDM SaaS.
   Enter the following prompt:

   ```
   Show all business entities in MDM
   ```

   The following image shows the response displaying all business entities in MDM SaaS:

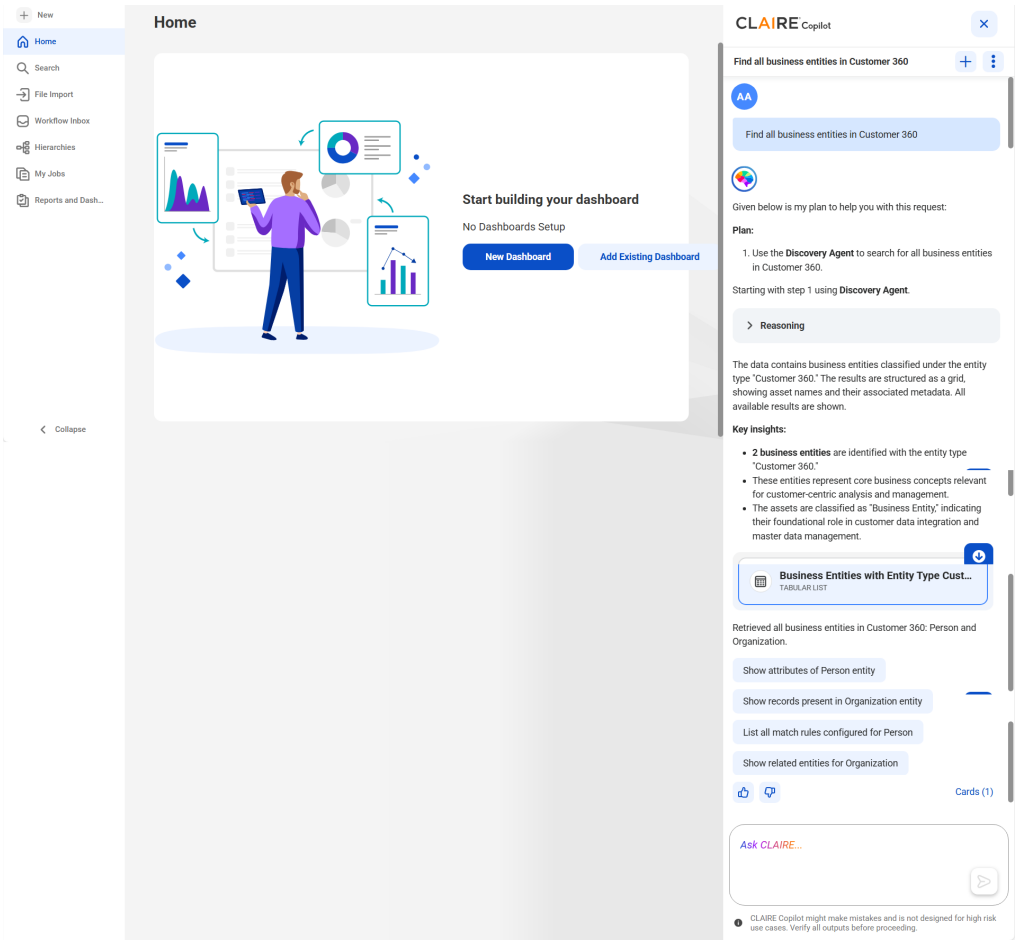

Using the data discovery skill, the discovery agent has found business entities that are available in MDM SaaS. You can expand the reasoning to view the query analysis process of the discovery agent.

To preview the business entities, click the card named **Business Entities in Mater Data Management**.

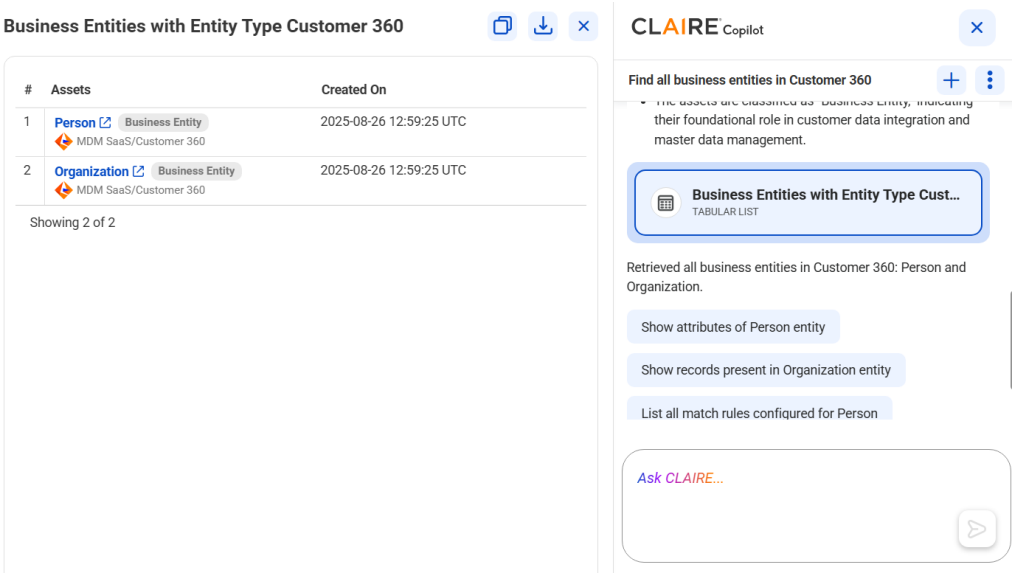

2. To find all business entities in Customer 360 SaaS, enter the following prompt:

```
Find all business entities in Customer 360
```

The following image shows the response displaying all business entities in Customer 360 SaaS:

CLAIRE Copilot
Find all business entities in Customer 360
AA
Find all business entities in Customer 360
Given below is my plan to help you with this request:
Plan:
1. Use the Discovery Agent to search for all business entities in Customer 360.
Starting with step 1 using Discovery Agent.
Reasoning
The data contains business entities classified under the entity type "Customer 360." The results are structured as a grid, showing asset names and their associated metadata. All available results are shown.
Key insights:
2 business entities are identified with the entity type "Customer 360."
These entities represent core business concepts relevant for customer-centric analysis and management.
The assets are classified as "Business Entity," indicating their foundational role in customer data integration and master data management.
Business Entities with Entity Type Cust...
TABULAR LIST
Retrieved all business entities in Customer 360: Person and Organization.
Show attributes of Person entity
Show records present in Organization entity
List all match rules configured for Person
Show related entities for Organization
Cards (1)

CLAIRE Copilot might make mistakes and is not designed for high risk use cases. Verify all outputs before proceeding.

3. .To preview all business entities, click the card named **Business Entities with Entity Type Customer 360**. The following image shows the canvas with a tabular view of business entities from Customer 360 SaaS:

You can click the business entity name to see the details in MDM SaaS.

Similarly, you can also discover business entities in Product 360 SaaS and Supplier 360 SaaS.

Additionally, CLAIRE Copilot displays prompt suggestions to explore relevant details.

CHAPTER 3

Explore metadata of assets

Explore, view, and understand the metadata of an asset in Multidomain MDM SaaS with CLAIRE Copilot.

Metadata exploration prerequisites

Before you perform metadata exploration tasks in CLAIRE Copilot for MDM SaaS, ensure that you perform the following tasks:

- Enable the MDM SaaS service for the runtime environment that your organization uses.
- Verify that business entities are available in MDM SaaS.
- Upgrade Customer 360 SaaS, Product 360 SaaS, and Supplier 360 SaaS to the latest version.

Metadata exploration sample prompts

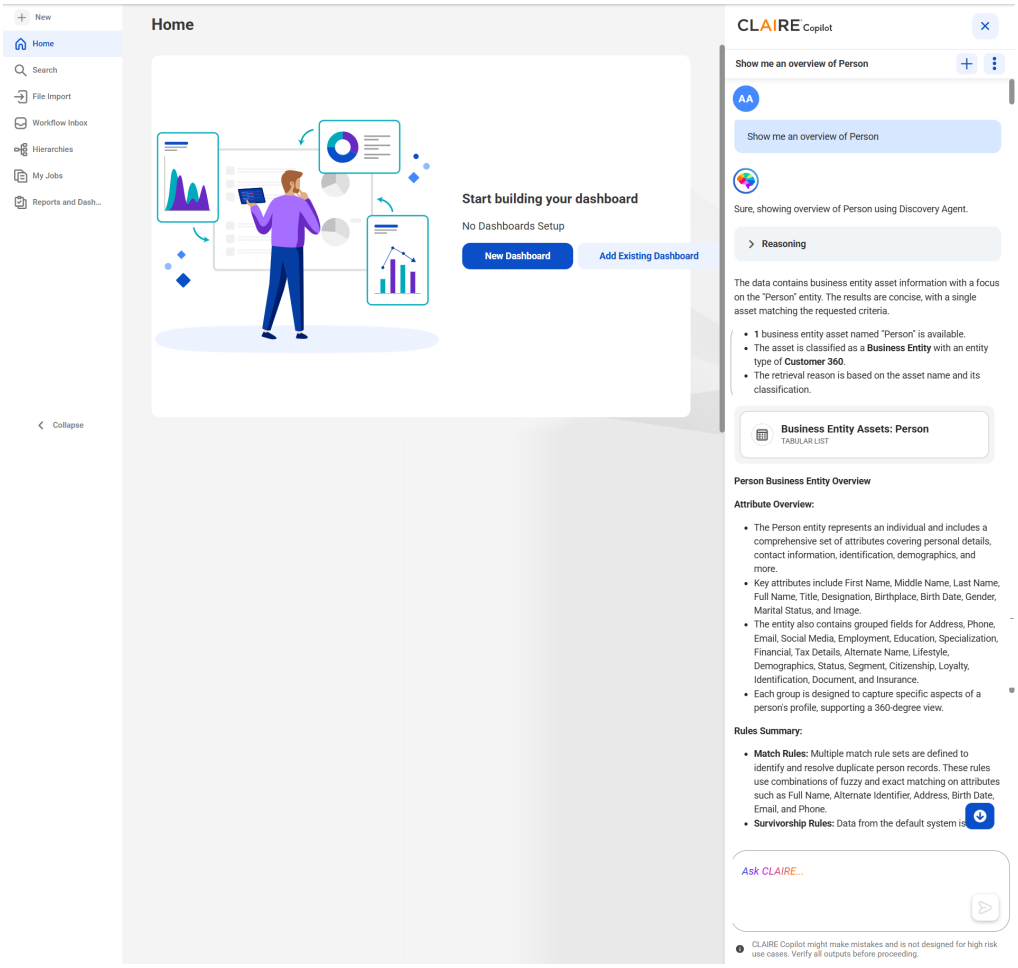

Let's take a look at a sample conversation to help you get started on your Multidomain MDM SaaS metadata exploration journey in CLAIRE Copilot.

For example, as a data steward, you want to view an overview of a business entity and explore its attributes, data quality rule associations, survivorship rules, and match rules configured for the business entity.

1. Start a conversation to see the metadata assets of the Person business entity.
   Enter the following prompt:

   ```
   Show me an overview of Person
   ```

   The following image shows the response displaying an overview of the Person business entity:

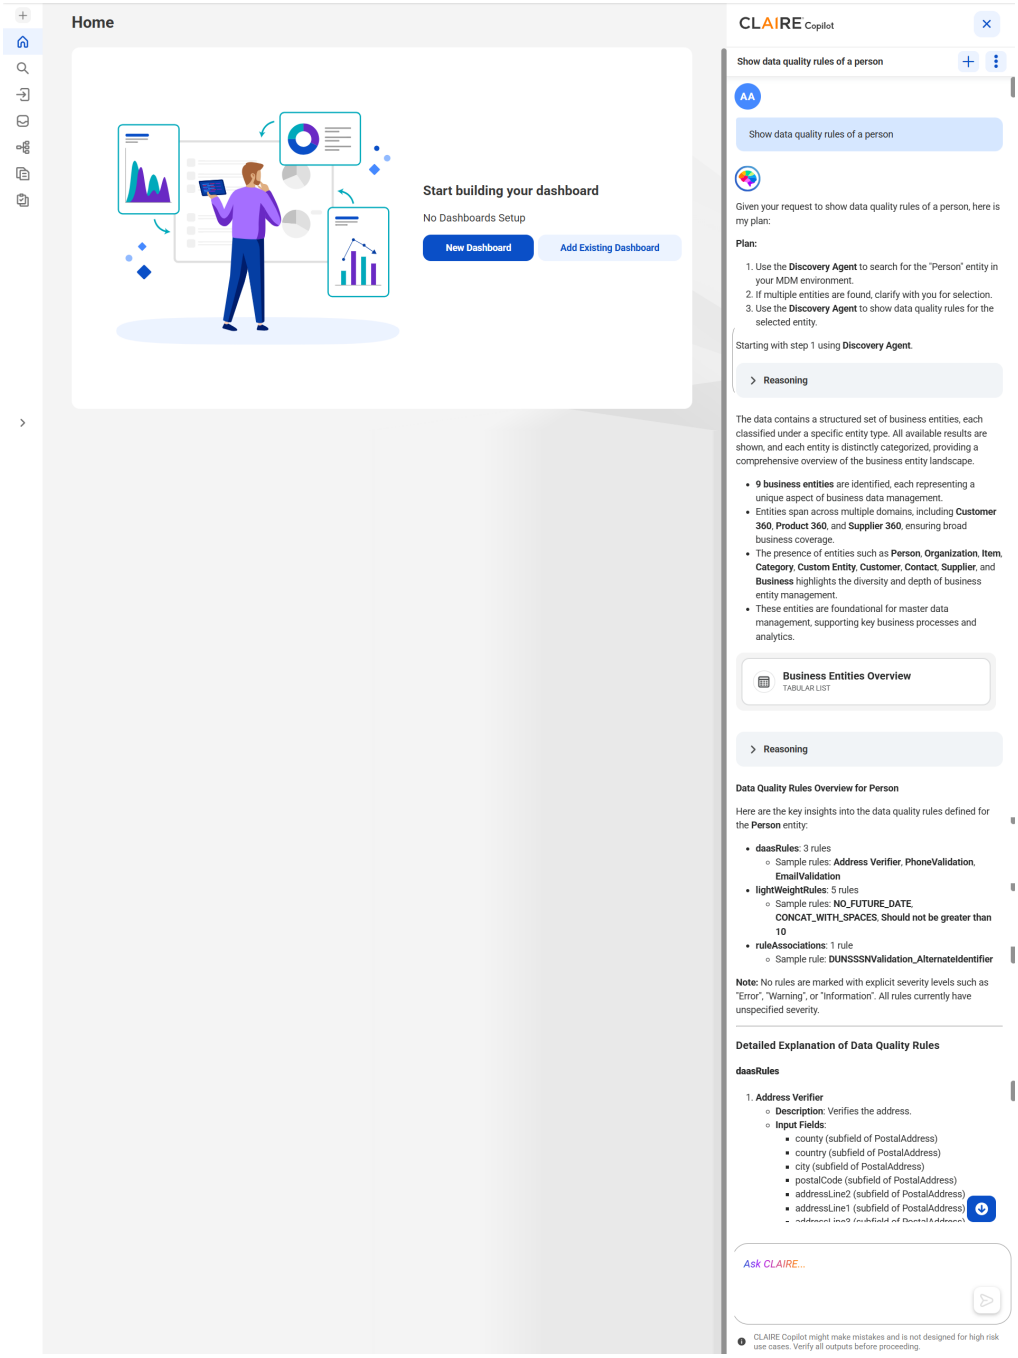

Using the metadata exploration skills, the discovery agent returns the description of the Person business entity, match rules, survivorship rules, and attributes.

Note: CLAIRE Copilot displays only the attributes that are configured as searchable in the business entity.

2. To view all data quality rule associations configured in the Person business entity, you can enter the following prompt:

   ```
   Show data quality rules for Person
   ```

   The following image shows the response displaying all data quality rule associations that are configured in the Person business entity:

3. If you want to view all attributes that you are allowed to edit in the Person business entity, you can enter the following prompt:

   ```
   What attributes am I allowed to edit in Person?
   ```

   The following image shows the response displaying all editable attributes in the Person business entity:

New
Home
Search
File Import
Workflow Inbox

My Jobs
Reports and Dash...
Collapse
Home
Start building your dashboard
No Dashboards Setup
New Dashboard
Add Existing Dashboard
CLAIRE Copilot
What attributes am I allowed to edit in Person?
AA
What attributes am I allowed to edit in Person?
Given your query, here is my plan:
Plan:
1. Use the Product Documentation Research Skill to find out which attributes are editable in the "Person" entity within MDM.
Starting with step 1 using Product Documentation Research Skill.
Reasoning
In Informatica MDM, the Person business entity contains a comprehensive set of editable attributes that capture personal, contact, demographic, and professional information. The editable (writable) attributes are organized into logical groups, and internal properties like assetIds, core.identity, core.externalId, and core.location are excluded from the editable list. Here are the main editable attributes for the Person entity:
Top-Level Editable Attributes:
firstName
middleName
lastName
fullName
prefixName
suffixName
title
designation
birthPlace
birthDate
gender
imageUrl
maritalStatus
Field Groups and Their Editable Fields:
PostalAddress: defaultIndicator, addressType, usageType, addressStatus, addressLine1, and other address-related fields
Phone: phone numbers, types, usage, validation status, and enrichment indicators
ElectronicAddress: email addresses, usage types, validation, and hygiene status
SocialHandle: social media handles and their types
ProfessionalDetail: designation, employer, location, employment type/status, and effective dates
Qualification: educational background, institution, student number, and address
Specialization: specialties and board certifications
Financial: financial data such as amount, currency, and reliability
TaxDetail: tax numbers, authorities, payment, and re dates

CHAPTER 4

Explore source data of assets

You can explore records with specific search criteria and download the sample data with CLAIRE Copilot.

You can explore only the active and valid records from MDM SaaS. After you search for records in CLAIRE Copilot, navigate to a specific MDM SaaS business application to view additional search results.

Data exploration prerequisites

Before you perform data exploration tasks in CLAIRE Copilot for MDM SaaS, ensure that you perform the following tasks:

- Enable the MDM SaaS service for the runtime environment that your organization uses.
- Verify that business entities are available in MDM SaaS.
- Upgrade Customer 360 SaaS, Product 360 SaaS, and Supplier 360 SaaS to the latest version.
- Ensure that the prompts include values from fields that are set as searchable and facetable in Business 360 Console.
  If the prompt contains data from fields that aren't searchable or facetable in Business 360 Console, CLAIRE Copilot can't visualize or search for data.

  For more information about searchable and facetable properties, see *Define the Data Model* in the Business 360 Console help.
- Verify that your user role has the read privilege for business entities and attributes that you use in the prompts.
- To retrieve accurate prompt responses, ensure that the business entity attributes contain meaningful descriptions in Business 360 Console.
  For example, a business entity includes two City attributes, one for address and one for the place of birth. If your prompt is to find customers living in New York, CLAIRE refers to the attribute description for the context.

Data exploration examples

Let's take a look at a sample conversation to help you get started on your data exploration journey in CLAIRE Copilot.

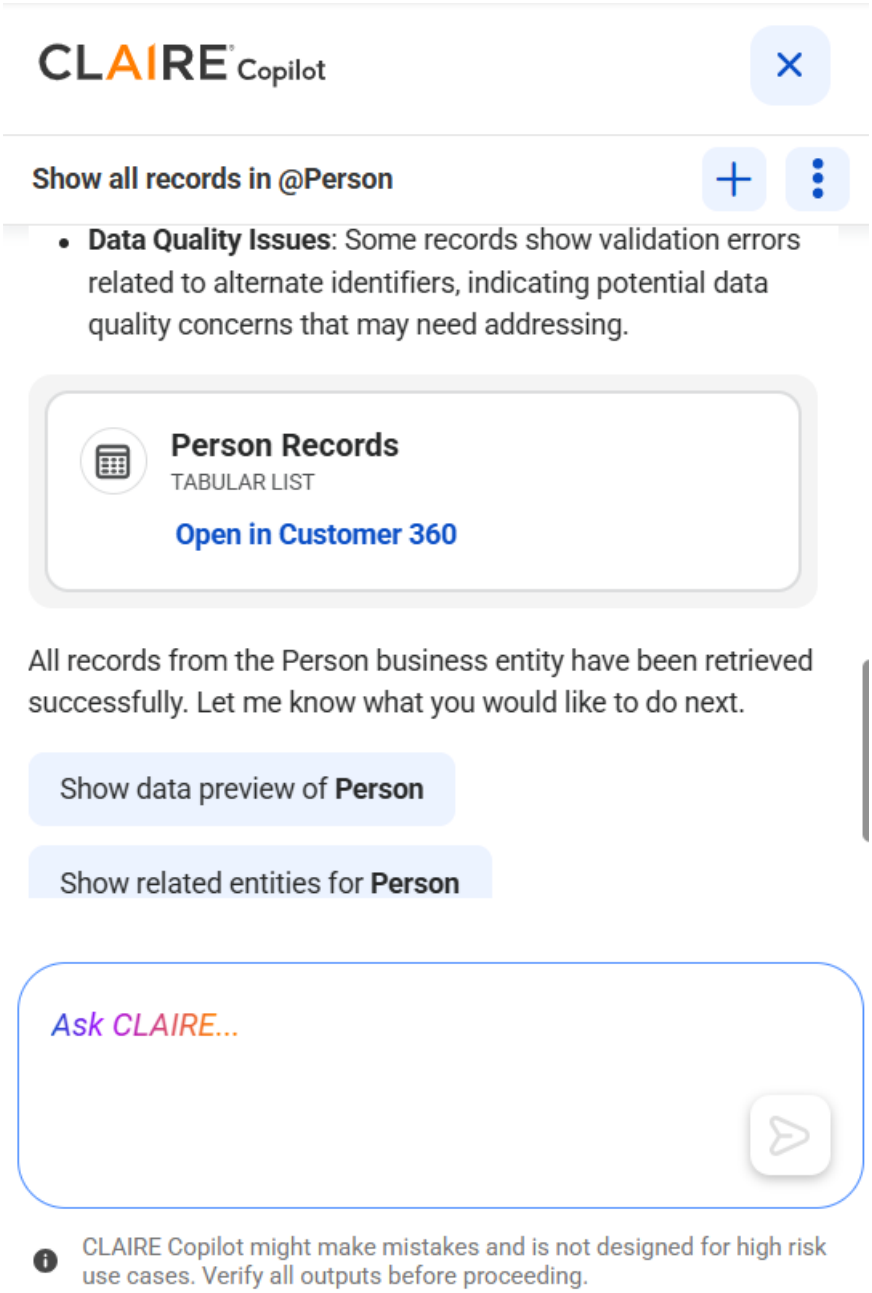

For example, as a data steward, you want to view all records in the person entity and use a pie chart to clearly visualize the distribution of loyalty account types. Additionally, you want to generate a bar chart to analyze person records by their address type to understand customer locations.

To achieve the goal, perform the following steps:

1. Start a conversation to see all records in the Person business entity.
   Enter the following prompt:

   ```
   Show all records in @Person
   ```

   The following image shows the response displaying a card containing all records in the Person business entity:

Using the data discovery agent, CLAIRE Copilot also recommends prompt suggestions. You can select from the suggested prompts for further analysis.

2. To view all records in a tabular view, click the card named **Person Records**.
The following image shows the response displaying a tabular view of all records in the Person business entity:

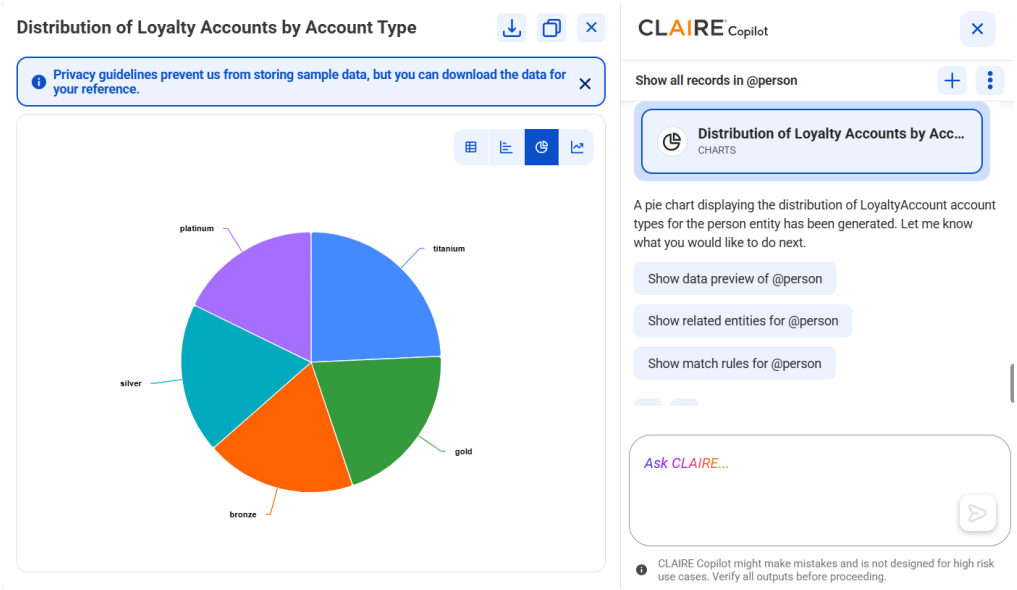

You can click a business ID to view the record. To copy and paste the sample data to a CSV file, click the **Copy** icon. To export the sample data to a CSV file, click **Download**.

3. To visualize the distribution of account types, enter the following prompt:

   ```
   Create a pie chart displaying the LoyaltyAccount: accountType for Person entity
   ```

   The following image shows the response displaying a pie chart that represents the records by account type:

4. To generate a bar chart to visualize the person records based on their state, enter the following prompt:

   ```
   Create a bar chart to visualize the Person records based on address: state
   ```

   The following image shows the response displaying a bar chart that represents the person records based on their states:

Distribution of Person Records by State

CHAPTER 5

Product experience agent

Use the product experience agent to enrich product records in MDM SaaS. You can access the product experience agent across all business applications. However, the agent is certified to enrich only product records.

The product experience agent autonomously performs tasks, makes decisions, and seeks human intervention when it can't make decisions on its own.

The agent can enrich records with data from PDF documents and from external sources. The agent can also classify records. After the agent completes its tasks, it generates a report that summarizes the number of extracted values, enriched fields, and objectives that it ran.

You can access the product experience agent in the following ways:

- Access the agent in CLAIRE Copilot, where it interprets your query and completes your request.
- Start a conversation in CLAIRE GPT, navigate to CLAIRE Copilot, and enrich records using the agent.

Preview Notice: Effective in the April 2026 release, the product experience agent is available to some customers for preview. Preview functionality is supported for evaluation purposes but is unwarranted and is not supported in production environments or any environment that you plan to push to production. Informatica intends to include the preview functionality in an upcoming release for production use, but might choose not to in accordance with changing market or technical circumstances. For more information, contact Informatica Global Customer Support.

Product experience agent skills

The product experience agent uses AI-powered skills to automate how product records are enriched.

The product experience agent includes the following key skills to enrich product records with intelligent autonomy:

- Extracts information from a PDF and enriches a record that is open with the extracted information.
- Autonomously corrects validation errors if the fields that the agent tries to enrich fail validation.
- Enriches records by running the on-request objectives that you select.
- Classifies records.

Enriching records through data extraction

The product experience agent can extract data from PDFs to enrich product records, which reduces manual data entry and improves record accuracy.

When you ask CLAIRE Copilot to enrich a record with information from a PDF, CLAIRE Copilot uses the skills of the product experience agent. The agent first creates a draft of the record and then updates it with extracted values. If the fields that the agent tries to enrich fail validation, the agent attempts to correct the values three times. You need to publish the draft to add the enriched data to the record.

Note: When you use CLAIRE Copilot to enrich records with PDF data, ensure that you own the PDF or have permission to use its data. Informatica is not responsible for copyright or licensing issues that arise from PDFs that you use in MDM SaaS. Verify your rights before you upload documents.

The agent can enrich only one record at a time. Also, you can upload only one PDF in each prompt. However, you can upload multiple PDFs across multiple prompts in a conversation.

The product experience agent extracts data from PDF and builds a knowledge graph based on the business entity that the records belongs to. By default, the agent tries to enrich all empty fields in the record. If the agent can't find relevant information for an empty field, it doesn't update the field. The agent can also overwrite values in existing fields based on your instructions.

Note: The agent can't overwrite data in field group entries or enrich a related record.

The agent doesn't convert mismatched reference data, such as currency or units of measurement. For example, if the PDF contains weight in pounds (lbs) and the record uses kilograms (kg), the agent doesn't convert the weight from pounds to kilograms to enrich the corresponding field.

If PDF contains a decimal value for a numeric field, the agent rounds it to the nearest integer. For example, if the PDF contains the value 23.7, the agent rounds it to 24. Also, the agent currently supports PDF extraction in English only.

For more information about guidelines to use PDF, see "Guidelines for using the product experience agent" on page 34.

Sample conversation

Use CLAIRE Copilot to enrich an incomplete record with PDF data.

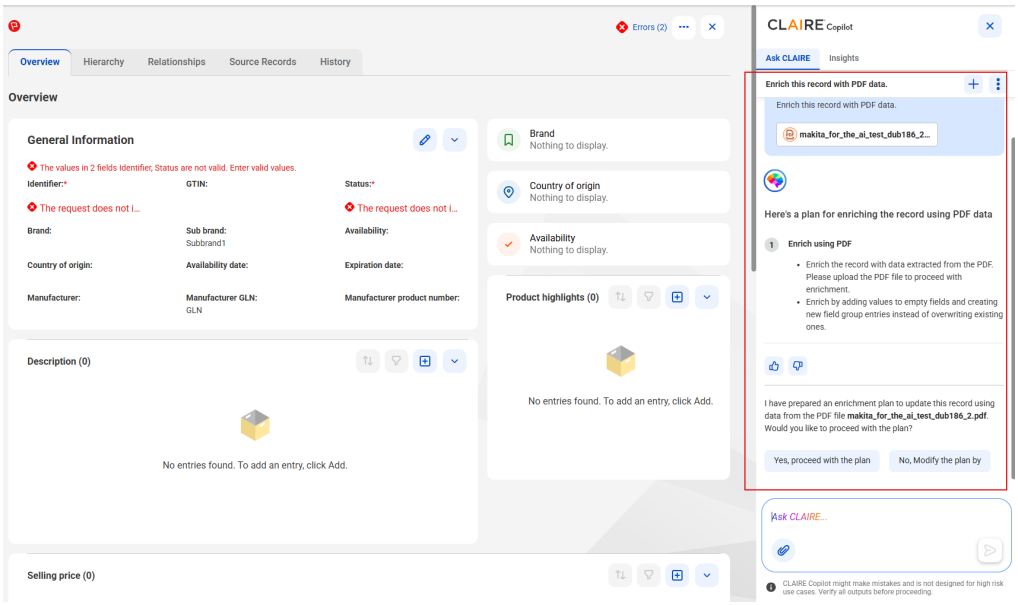

Let's look at a sample conversation that shows how to use CLAIRE Copilot to enrich a record with data from a PDF. Your organization has an incomplete record named Blower LXT in Product 360 SaaS. You want to enrich this record with data from a product brochure.

1. In Product 360 SaaS, open the Blower LXT record.
2. Start a conversation with CLAIRE Copilot to enrich the record, upload a PDF, and enter the following prompt:

   ```
   Enrich this record with PDF data.
   ```

   The product experience agent uses the product enrichment skill and displays a comprehensive plan to enrich the record.

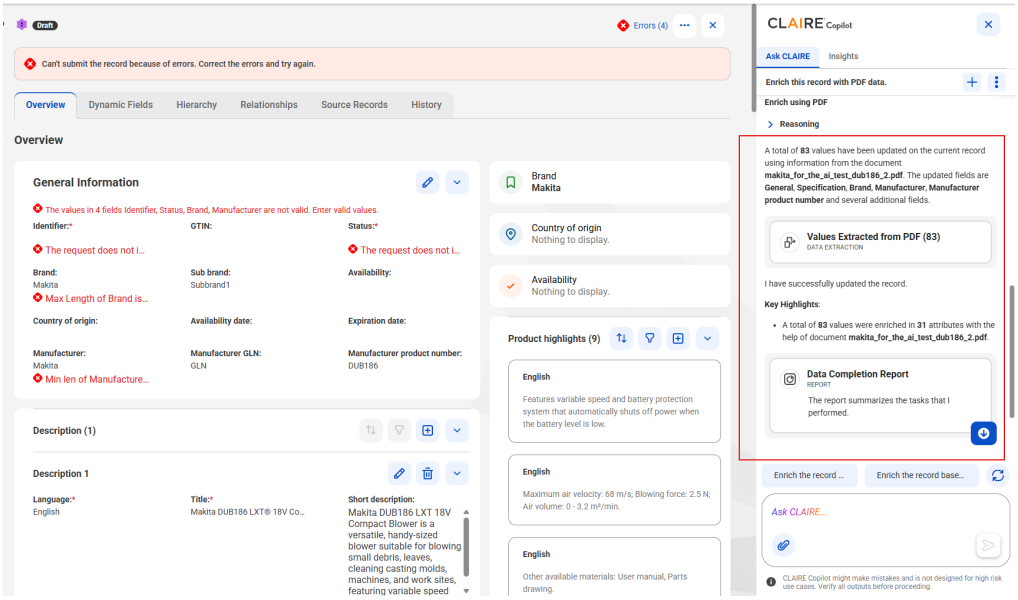

The following image shows the enrichment plan that the product experience agent displays after you submit the prompt with the uploaded PDF:

3. Click **Yes, proceed with the plan**, and submit the prompt.

   The agent extracts data from the uploaded PDF and enriches the record. After the agent completes enriching the record, the record appears in the draft state. CLAIRE Copilot also displays the Values Extracted from PDF and Data Completion Report cards.

   The following image shows the enriched record in the draft state with the Values Extracted from PDF and Data Completion Report cards in the CLAIRE Copilot panel:

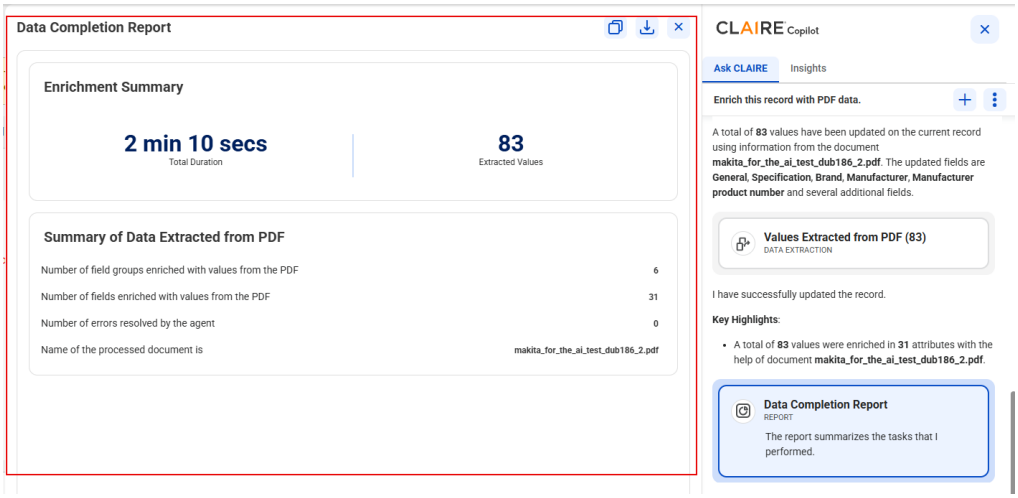

4. To view the extracted values and enriched fields, click the **Values Extracted from PDF** card.

The **Values Extracted from PDF** workspace appears.

5. To view the summary of enrichment, click the **Data Completion Report** card.

   The **Data Completion Report** workspace appears.

6. Submit the record.

Enriching a record using on-request objectives

The product experience agent can enrich records by running on-request objectives configured for fields.

When your prompt CLAIRE Copilot to enrich a record using objectives, the agent displays the on-request objectives configured for fields. You can ask the agent to run specific objectives or all of them.

The agent can't run the following types of objectives:

- Automatic objectives
- Objectives to display enrichment data as recommendations
- Objectives to perform validation and cleansing

Sample conversation

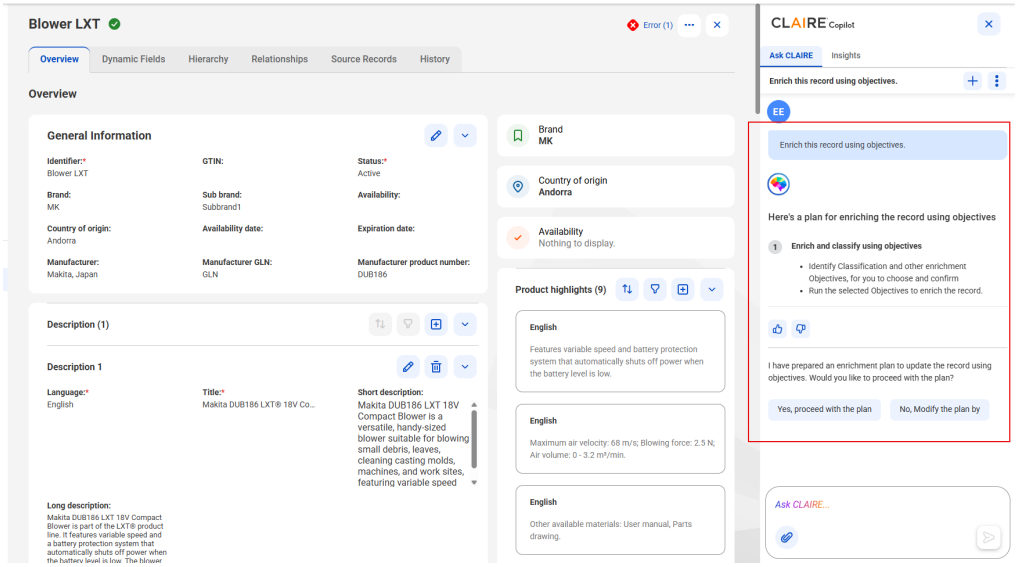

Let's look at a sample conversation to show how to enrich a record by using on-request objectives in CLAIRE Copilot.

Your organization has an incomplete record named Blower LXT in Product 360 SaaS. You want to enrich this record from external sources through configured objectives.

1. In Product 360 SaaS, open the Blower LXT record.
2. Start a conversation with CLAIRE Copilot to enrich the record using objectives, and enter the following prompt:

   Enrich this record using objectives.

   The product experience agent displays a comprehensive plan to enrich the record.

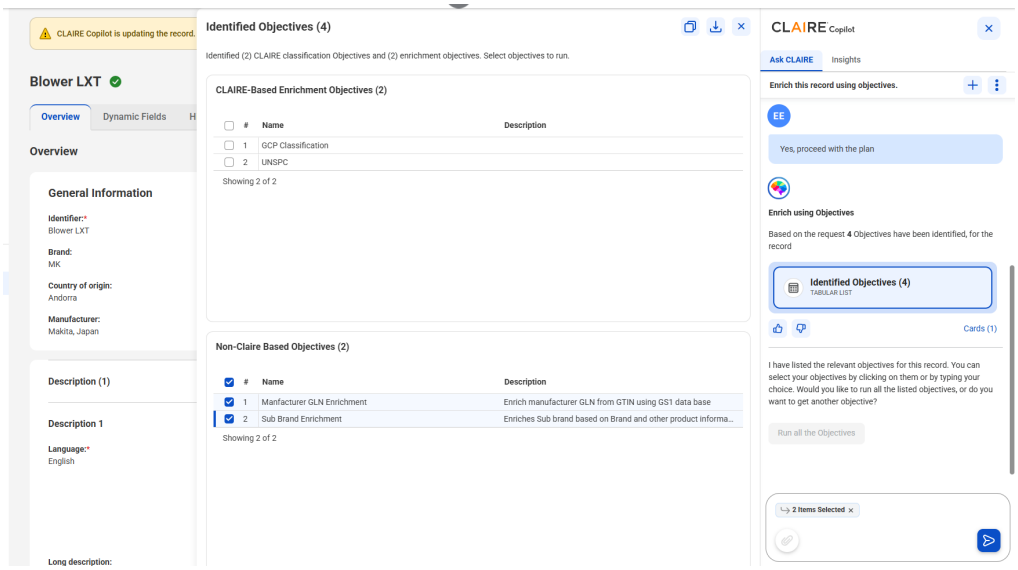

3. Click **Yes, proceed with the plan**, and submit the prompt.

The product experience agent identifies the on-request objectives and the Identified Objectives card appears.

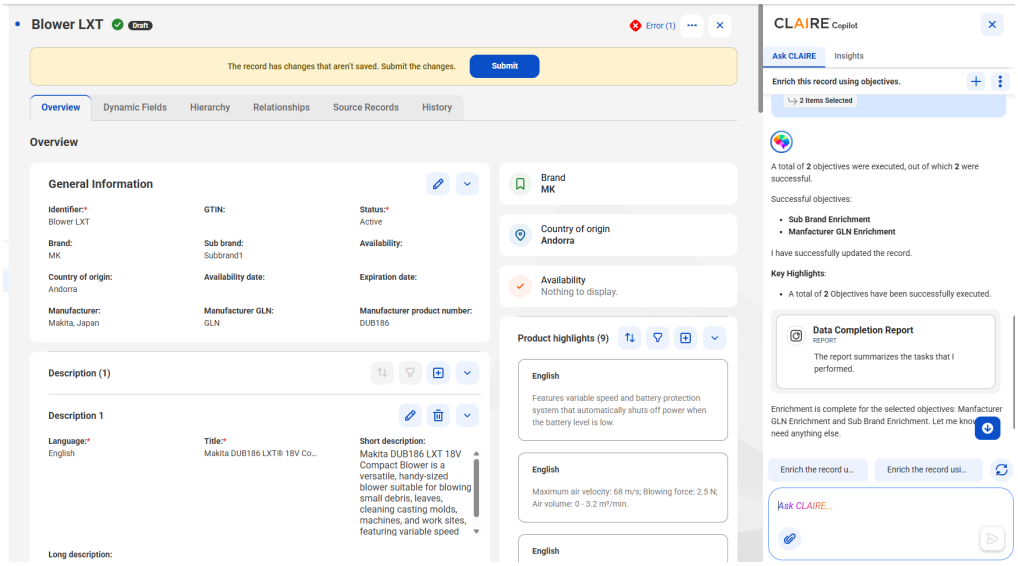

4. Click the **Identified Objectives** card, and select the objectives that you want to run, or ask the agent to run all the objectives.

   The objectives that you select appear in the prompt box.

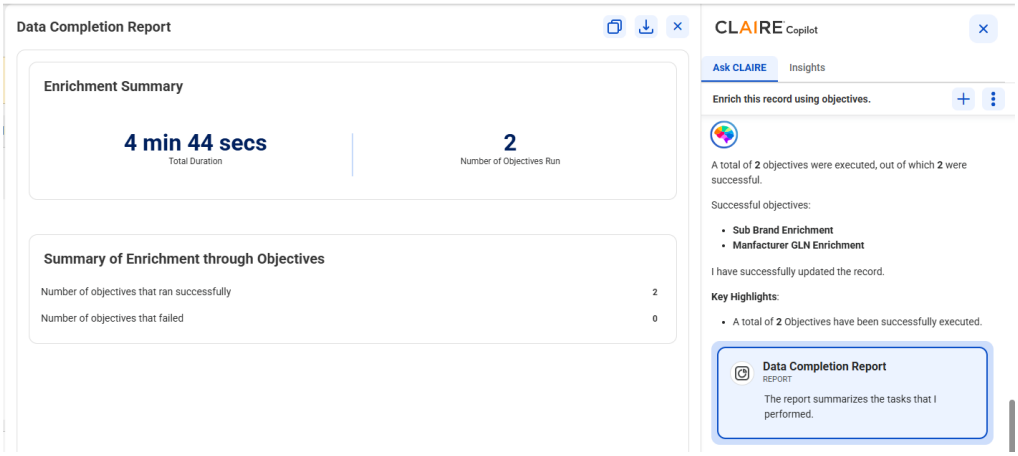

5. Submit the objectives that you selected.

CLAIRE Copilot displays the names of the objectives that it ran successfully.

6. To view the details of the data completion report, click the **Data Completion Report** card.

   The Data Completion Report workspace appears.

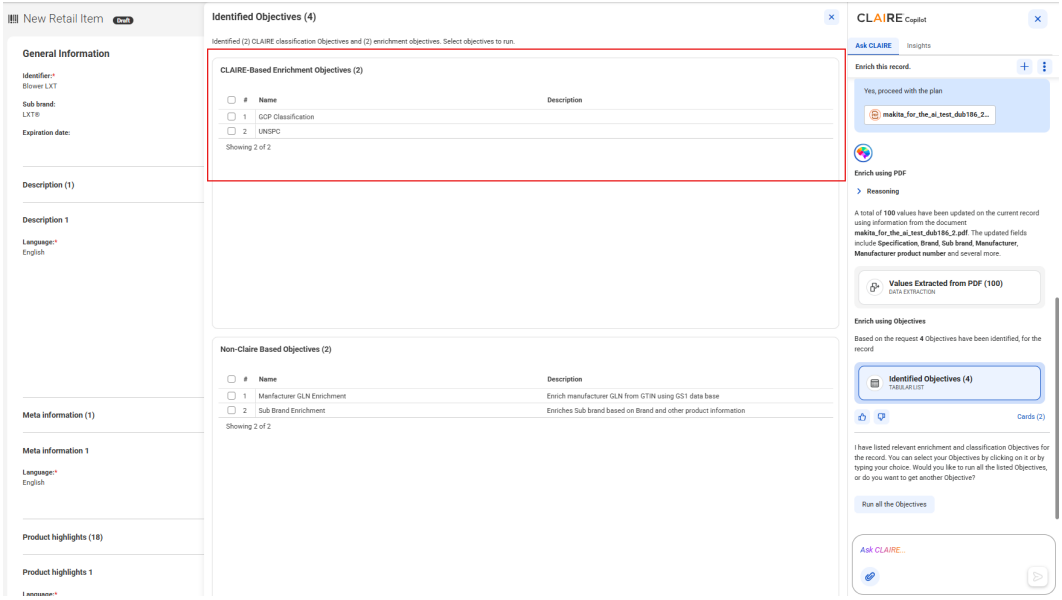

7. Submit the record.

Classifying records

The product experience agent classifies records by assigning them to relevant hierarchies based on configured objectives and confidence scores.

When you ask CLAIRE Copilot to classify a record, the agent identifies the objectives that are configured for classification. You can select specific objectives or ask the agent to run all the objectives.

The following image shows two classification objectives in the CLAIRE-Based Enrichment Objectives section of the Identified Objectives workspace:

After you submit the selected objectives, the agent identifies relevant hierarchies and nodes based on the details available in those objectives, such as hierarchy and relationship types. It then recommends parent records and hierarchy nodes for classification, along with confidence scores.The record is assigned to a recommended hierarchy if the confidence score meets or exceeds the accept threshold specified in the configuration.

When you prompt the agent to enrich a record without asking it to classify it, it automatically runs classification objectives along with other tasks. You can also specifically ask the agent to classify records.

After the agent assigns a record to a hierarchy, the dynamic fields from the parent record become available in the classified record.

Note: The agent assigns records only to hierarchies that a process hierarchies job processed.

Note: Effective in the April 2026 release, the ability to classify records using the product experience agent is available for preview.

Sample conversation

Let's look at a sample conversation to show how to classify a record by using CLAIRE Copilot.

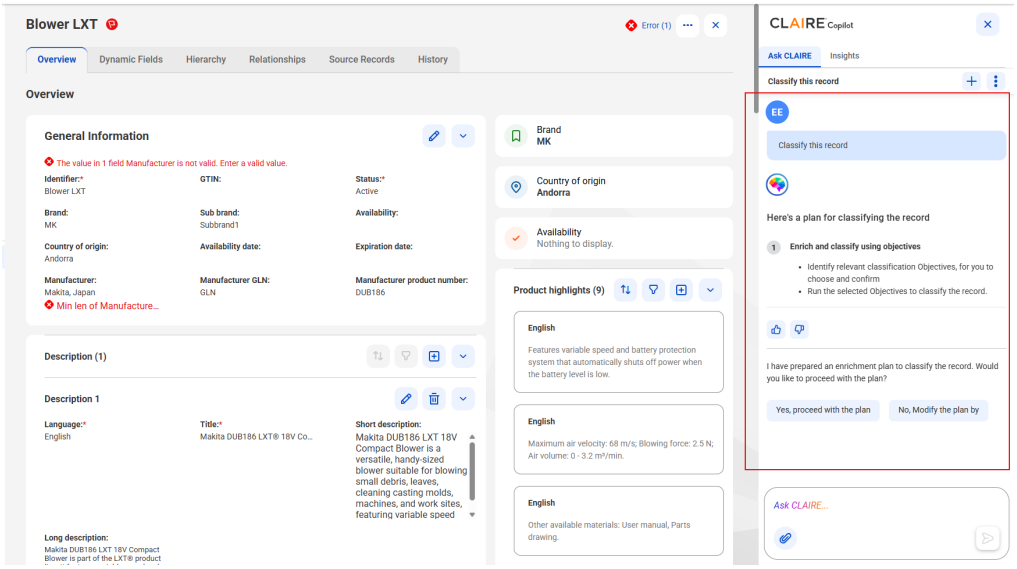

Your organization has a record named Blower LXT in Product 360 SaaS. You want to assign this record to relevant hierarchies through configured classification objectives.

1. In Product 360 SaaS, open the Blower LXT record.
2. Start a conversation with CLAIRE Copilot to classify the record, and enter the following prompt:

   ```
   Classify this record.
   ```

   The product experience agent uses the product classification skill and displays a comprehensive plan to classify the record.

The following image shows the classification plan that CLAIRE Copilot displays in response to the prompt:

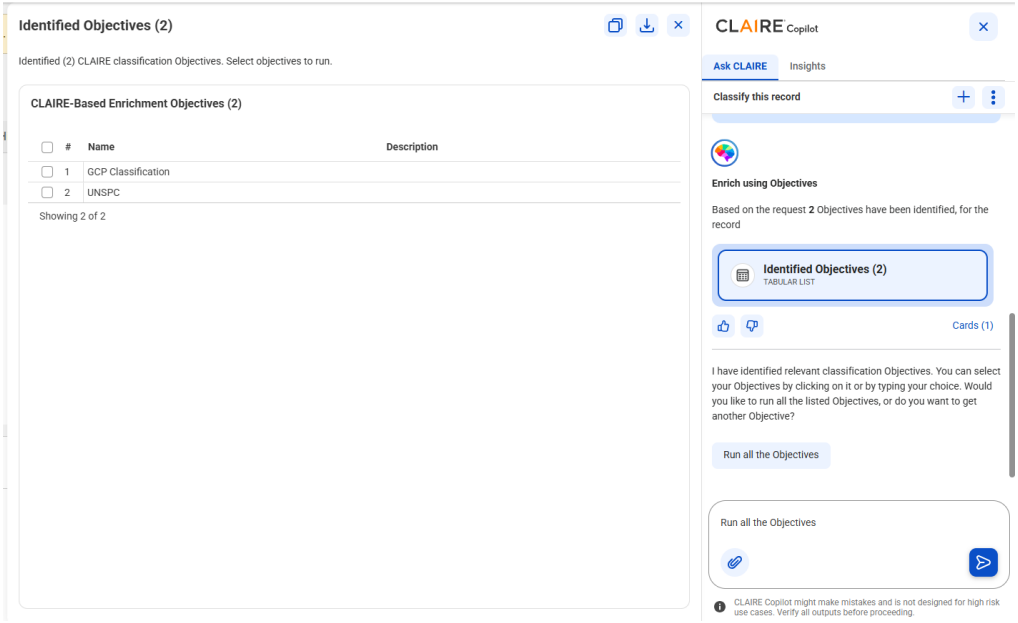

3. Click **Yes, proceed with the plan**, and submit the prompt.

   The product experience agent identifies the objectives that are configured for classification and displays the Identified Objectives card.

4. Click the **Identified Objectives** card, and select the objectives that you want to run or ask the agent to run all the objectives.

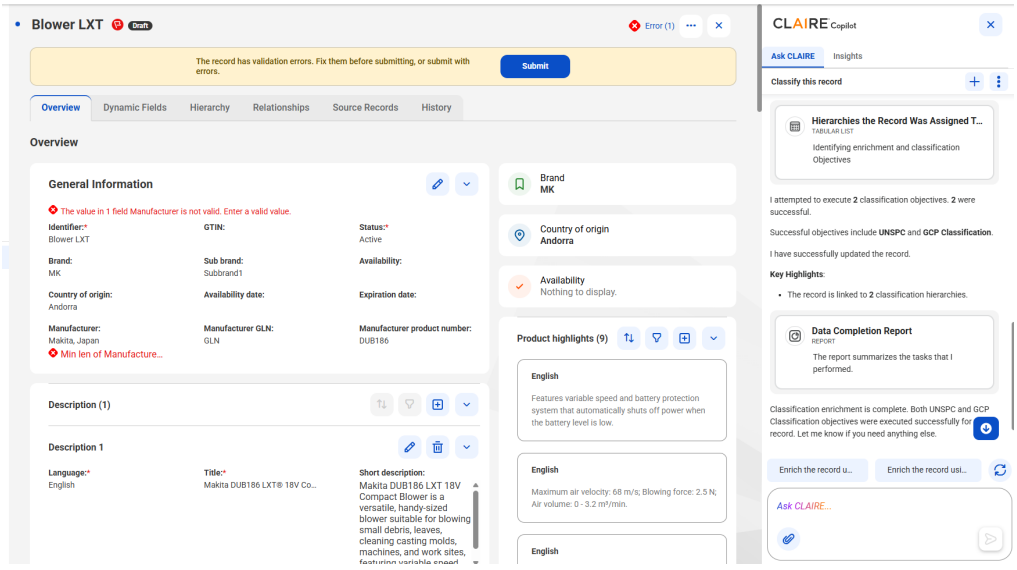

The objectives that you select appear in the prompt box.

5. Submit the objectives that you selected.

   The agent identifies relevant hierarchies and nodes based on the details available in those objectives, such as hierarchy and relationship types. It then recommends parent records and hierarchy nodes for classification, along with confidence scores. The record is assigned to a recommended hierarchy if the confidence score meets or exceeds the accept threshold specified in the configuration. CLAIRE Copilot displays the Hierarchies the Record Was Assigned to card.

   The following image shows the results that CLAIRE Copilot displays after it runs the classification objectives:

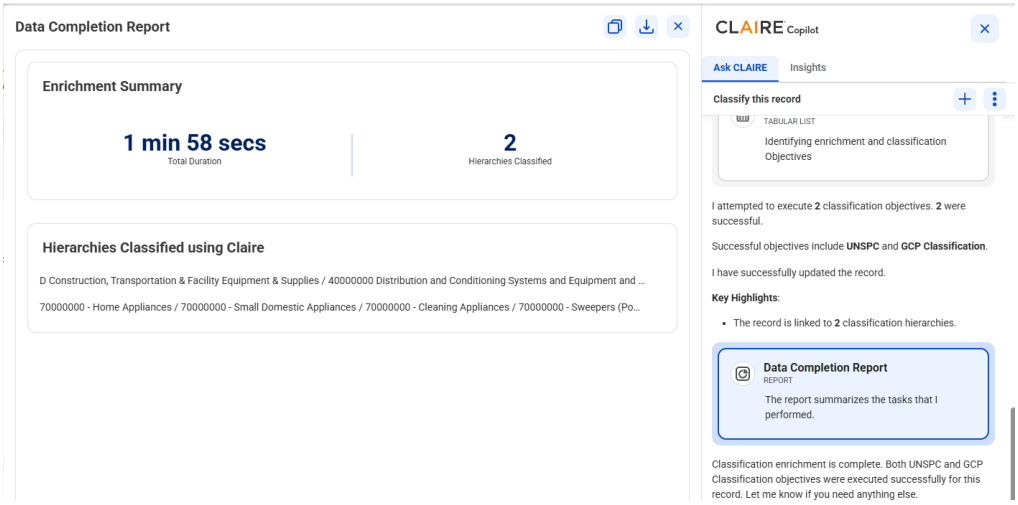

6. To view the hierarchies that the record is assigned to, click the **Hierarchies the Record Was Assigned to** card.

The Hierarchies the Record Was Assigned to workspace appears.

7. To view the summary of the classification task, click the **Data Completion Report** card.

   The Data Completion Report workspace appears.

8. Submit the record.

Guidelines for using the product experience agent

Consider the following rules and guidelines when you use product experience agent in CLAIRE Copilot for MDM SaaS:

- Ensure that you have access to the fields that you want the agent to enrich.
- Before you start a conversation, open the record that you want the agent to enrich.
- Upload only one PDF in a prompt. You can upload multiple PDFs across different prompts in the same conversation.
- Ensure that each PDF file is 20 MB or smaller.

- Upload text-based PDFs. The agent can extract text only from PDFs that contain data in text format, not as scanned images.
- Don't upload PDFs that contain watermarks. The agent can't extract text from them.
- After the agent creates and enriches a draft of the record, ensure that you publish the draft manually because the agent can't publish it for you.
- Ensure that records aren't in the pending status. The product experience agent can't enrich or classify records that are in the pending status.
