Chapter 8: Quick reference 40

Preface

Read *Using CLAIRE GPT* to learn how to use CLAIRE GPT to perform tasks across Intelligent Data Management Cloud services.

CHAPTER 1

Using CLAIRE GPT

Use CLAIRE GPT's AI-powered agentic data management solution with a natural language interface to simplify data management with Intelligent Data Management Cloud services, resulting in enhanced productivity and efficiency.

CLAIRE GPT is built on top of CLAIRE, Informatica's AI machine learning engine that powers data management solutions. You can enter natural language prompts to start conversations with CLAIRE GPT and process, analyze, and manage your data spread across various Intelligent Data Management Cloud services.

CLAIRE GPT utilizes CLAIRE agents for efficient autonomous data management. CLAIRE agents harness advanced AI reasoning and planning models to automate complex data operations that range from data ingestion and lineage tracking to data quality assurance. CLAIRE agents redefine how you interact with Intelligent Data Management Cloud services. The agents have specialized skills that enable them to achieve end-to-end data management objectives through intelligent autonomy. Each agent is designed to excel at specific aspects of data management, and they collaborate to provide comprehensive solutions.

You can use the following CLAIRE agents for autonomous data management:

- Discovery agent
- Data quality agent
- Data integration agent
- Product help agent

CLAIRE GPT integrates with the following Intelligent Data Management Cloud services to help you easily solve your data management business use cases:

- Chapter 2, “Data Governance and Catalog” on page 6
- Chapter 4, “Data Integration” on page 21
- Chapter 6, “Data Marketplace” on page 30
- Chapter 5, “MDM SaaS” on page 25

CHAPTER 2

Data Governance and Catalog

CLAIRE GPT integrates with Data Governance and Catalog to help you discover assets, explore metadata of assets, assess the quality of your data, explore source data, and identify data sets that meet your business requirements.

The following table lists the Data Governance and Catalog tasks that you can perform using CLAIRE GPT:

Task	Description
Data discovery	Quickly search and discover assets from the catalog of enterprise assets. Start conversations to search for data assets relevant to your business use case and discover semantically similar assets. You can find assets by catalog source type, created date, owner, name, and relationships.
Metadata exploration	Explore, view, and understand the metadata of an asset present in the catalog of enterprise assets. Metadata exploration includes identifying an asset's overview, stakeholders, data profile, data quality score, ratings, lineage, and system attributes.
Data quality	Analyze the data quality of assets in your organization, detect outliers, and get data quality rule recommendations for the assets.
Data exploration	Understand the quality and shape of your source data and identify data anomalies.

Analyze customer data to create a marketing campaign

You're a data analyst at a retail company and your organization's retail customer data is stored in a Snowflake data warehouse, and cataloged in Data Governance and Catalog. You want to analyze customer data and the purchase pattern to design a targeted marketing campaign. You want to look at the details associated with customer purchase patterns in the data catalog and decide which information will be helpful in your analysis and impactful for your campaign.

To achieve this goal, you can take the following approach:

- First, you can discover relevant customer data sets. You can search for customer data sets in the Snowflake source that are profiled, have high data quality scores, and contain critical data elements. To discover assets, CLAIRE GPT utilizes the data discovery skill of the discovery agent.
- After discovering data sets, you can explore the metadata of the discovered data and get an overview of the most suitable data set. To explore metadata of assets, CLAIRE GPT utilizes the metadata exploration skill of the discovery agent.

- Then, you can explore the source sample data to analyze the purchase pattern for the top-selling product across different age groups. To explore source data, CLAIRE GPT utilizes the data exploration skill of the discovery agent.

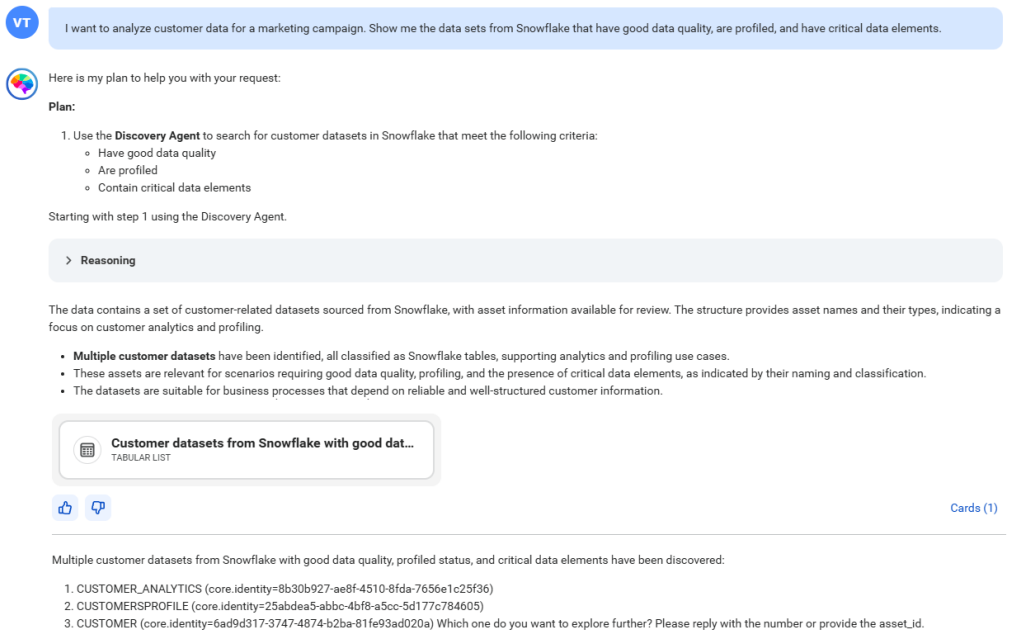

Following the approach, you can analyze the purchase pattern of customers and design a targeted marketing campaign.
For more information about the discovery agent, see *Discovery Agent* in Data Management Agents.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to search customer data sets in Snowflake catalog sources that are profiled, have high data quality scores, and contain critical data elements.
   Enter the following prompt:

   ```
   I want to analyze customer data for a marketing campaign. Show me the data sets from Snowflake that have good data quality, are profiled, and have critical data elements.
   ```

   The following image shows the response displaying data sets across Snowflake catalog sources that are profiled, have high data quality scores, and contain critical data elements:

   To view the data sets, click the card named **Customer datasets from Snowflake with good data quality, profiling, and critical data elements**.

   You can expand the reasoning to view the analysis process of the discovery agent.

   The following image shows the canvas with a tabular view of the customer data sets in Snowflake:

You can click an asset name to open it in Data Governance and Catalog.

3. To understand more about a data set, you can explore the metadata and take a closer look at the CUSTOMERSPROFILE table in Snowflake.
   You can either type the number corresponding to the data set or type the data set name, CUSTOMERSPROFILE.

   The following image shows the response displaying an extensive overview of the CUSTOMERSPROFILE table:

You can see that the data has a high data quality score, it has been profiled, and it has the key metrics you need for the analysis. You can also see who the stakeholders are in case you need to request access to the data.

To view the overview in detail, click the card named **CUSTOMERSPROFILE Asset Overview**.

The following image shows the canvas with a detailed overview of the CUSTOMERSPROFILE table:

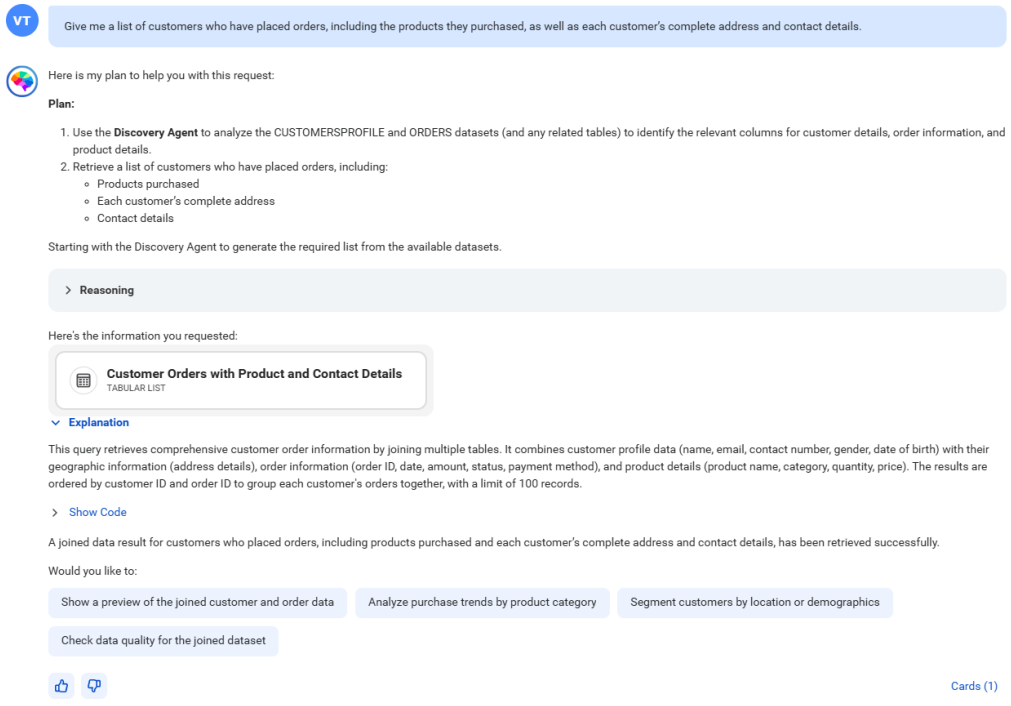

4. To explore source data, you can look at some of the sample data in this table.
Enter the following prompt:

```
Give me a list of customers who have placed orders, including the products they
purchased, as well as each customer's complete address and contact details.
```

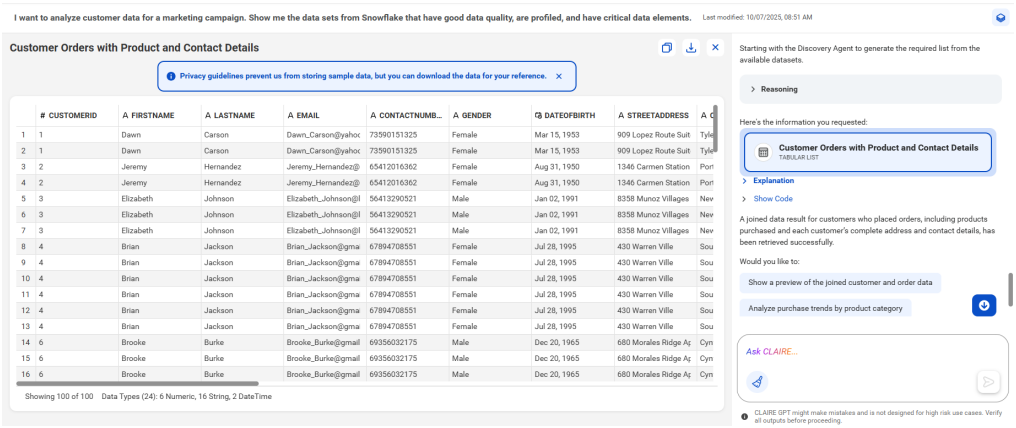

To get this information, CLAIRE GPT identifies and joins the CUSTOMERSPROFILE table with the ORDERS and PRODUCTS tables.

The following image shows the response displaying a list of customers who have placed orders along with the products they bought and their full addresses and contact details:

To preview the source data, click the card named **Customer Orders with Product and Contact Details**.

The following image shows the canvas with a sample of source data after joining the CUSTOMERSPROFILE table with the ORDERS and PRODUCTS tables:

You can copy or download this list and use it for further analysis. To copy and paste the sample data to a CSV file, click the **Copy** icon. To export the sample data to a CSV file, click the **Download** icon.

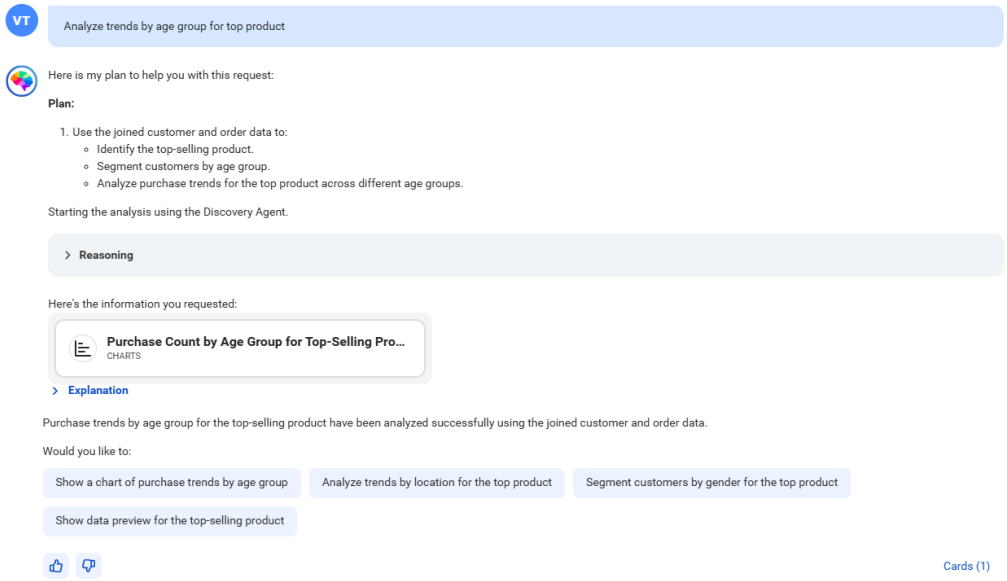

Click **Explanation** for a comprehensive explanation on how the data is fetched. To see the SQL code used to fetch the sample data, click **Show Code**.

5. To design the marketing campaign, you can analyze trends by age group for the top-selling product. Enter the following prompt:

   ```
   Analyze trends by age group for top product
   ```

   To get this information, CLAIRE GPT identifies the top-selling product, segments customers by age group, and analyzes purchase trends for the top-selling product across different age groups.

   The following image shows the response displaying the analysis details:

   To see the analysis details, click the card named **Purchase Count by Age Group for Top-Selling Product**.

   The following image shows the canvas with a sample of source data in a bar chart:

By default, a bar chart appears. You can switch between tables, bar charts, pie charts, and line charts.

You can continue to drill down the data until you get all the details you need for the marketing campaign. This reduces your workload significantly.

You were able to quickly identify assets of interest and perform data discovery, metadata exploration, and data exploration using simple natural language prompts.

CHAPTER 3

Data Quality

CLAIRE GPT integrates with Data Quality to analyze assets, perform on-demand data profiling, detect outliers, and suggest rules to identify data discrepancies. To enhance data accuracy and governance, you can also cleanse data and generate rule specifications from natural language rule descriptions in files or prompts.

The following table lists the Data Quality tasks that you can perform using CLAIRE GPT:

Task	Description
Data quality assessment	Discover and analyze assets based on data quality scores, status, or specific criteria, and view summaries that highlight data types, and key statistics, and outliers. If a data profile is missing, CLAIRE GPT performs on-demand profiling to generate the data profile. Start your conversations to explore and evaluate data quality from a business perspective.
Data quality diagnosis	Identify the reasons for poor data quality scores in your asset. Get insights on the data elements and dimensions that led to the poor scores, the data quality rules that contributed to the poor scores, or any records that violated data quality rules.
Data quality rule recommendation	Get data quality recommendations for your data assets to define and improve the data quality standards for your data assets. After you accept a rule that CLAIRE GPT recommends, a rule occurrence is created in Data Governance and Catalog.
Data quality cleanse	For the data sets in your catalog or a file that you upload, get recommendations for cleanse rules for your data. After you accept and apply the cleanse rules, the agent identifies and corrects errors or inconsistencies in data sets and generates cleansed data to enhance accuracy, completeness, and reliability. Additionally, generate mapplets to create a reusable data cleansing process for similar data sets in the future.
Data quality rule generation	Extract business rules from an uploaded file or prompt that contains data quality rule descriptions in natural language, sample data, or a specified catalog source, and convert them into data quality rule specifications in Data Quality.

Verify sales data and improve the quality of the data

You’re a data steward at a retail company. Your company's sales data is stored in a data warehouse and cataloged in Data Governance and Catalog. You want to ensure that the quality of the sales data is accurate, reliable, and meets the data quality standards. You identify the data sets that don't have data quality scores associated with them, analyze the data set, get recommendations for data quality rules, and apply the

recommended rules to set standards for accuracy, completeness, and consistency for your organization data.

To achieve this goal, you can take the following approach:

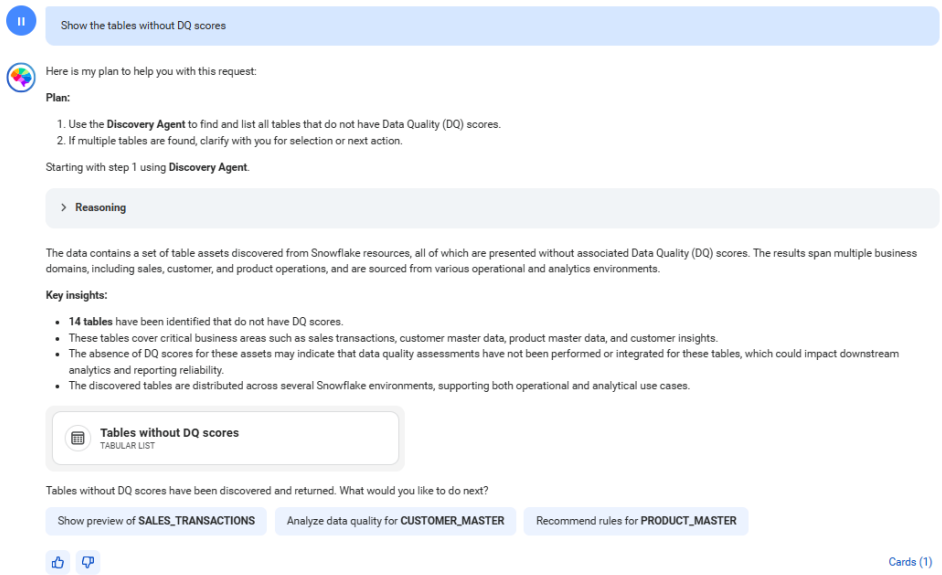

- First, you discover tables in your catalog that have no data quality scores. To discover assets, CLAIRE GPT utilizes the data discovery skill.
- After you discover tables with no data quality scores, you assess the profiling statistics of a table of your choice. To show the assessment and profiling results of a data set, CLAIRE GPT utilizes the data quality assessment skill of the data quality agent.
- Finally, you get data quality rule recommendations and apply the rules on the table to establish the data quality criteria and create data quality rule occurrences for the data elements in your catalog. To recommend rules, CLAIRE GPT utilizes the data quality rule recommendation skill of the data quality agent.

By following this approach, you can analyze the quality of the sales data and define the data quality criteria for the data.
To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to identify the tables that do not contain data quality scores.
   Enter the following prompt:

   ```
   Show the tables without DQ scores
   ```

   The following image shows the response displaying the key insights on the tables that don't have data quality scores:

   To view the list of all tables without data quality scores, click the card named **Tables without DQ scores**.

   You can expand the reasoning to view the analysis process of the discovery agent.

   The following image shows the canvas with a tabular view of the tables without data quality scores:

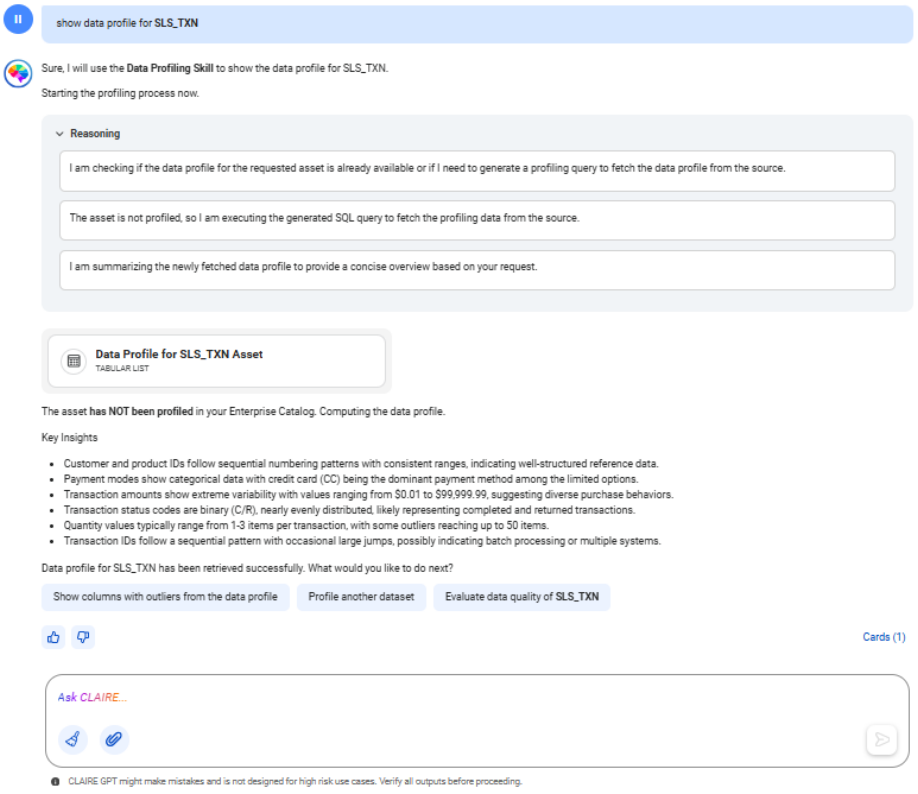

You can click a table name to open it in Data Governance and Catalog and see further details.

3. To understand more about any table, you can assess the profiling details of the table.
   Enter the following prompt:

   ```
   show data profile for SLS_TXN
   ```

   The following image shows the response displaying the profile of the **SLS_TXN** table:

You can see that since the table wasn't profiled earlier, CLAIRE GPT performed on-demand data profiling of the table.

To view the detailed profiling information, click the card named **Data Profile for SLS_TXN Asset**.

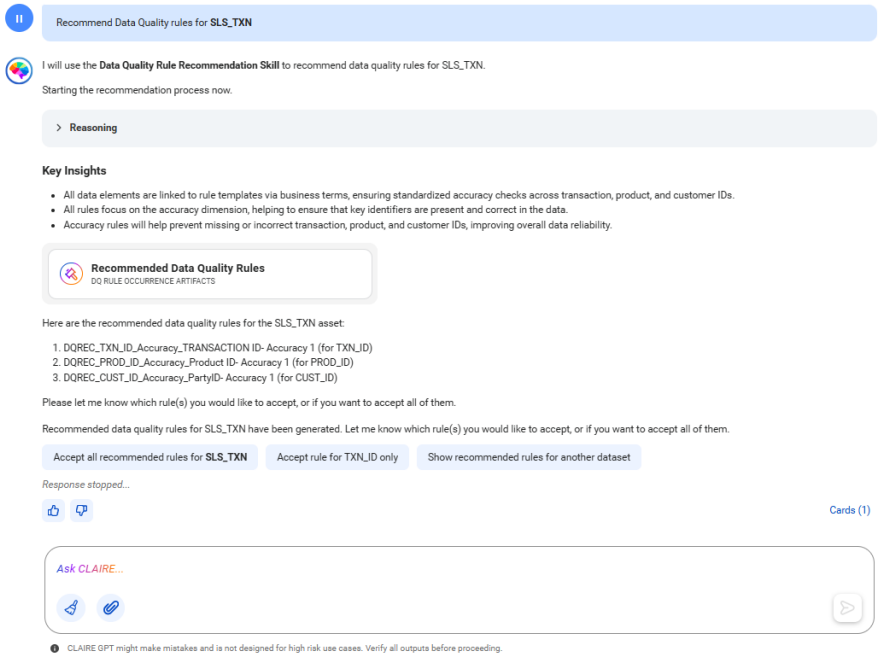

The following image shows the canvas with a detailed profile of the **SLS_TXN** table:

4. Based on the profiling results and assessment of the table, get data quality rule recommendations for the **SLS_TXN** table.
   Enter the following prompt:

   ```
   Recommend Data Quality rules for SLS_TXN
   ```

   The following image shows the response displaying recommended data quality rules for the **SLS_TXN** table:

   To preview all the rules, click the **Recommended Data Quality Rules** card.

   The following image shows the canvas with a tabular view of recommended data quality rules that are retrieved from Data Quality:

You can copy or download the list and use it for further analysis. To copy the rules to a CSV file, click the **Copy** icon. To export the rules to a CSV file, click the **Download** icon.

5. If you are happy with the recommended rules, click **Accept all recommended rules for SLS_TXN**.
   After you accept the recommended rules, Data Quality runs the rules on the **SLS_TXN** table and creates rule occurrences in Data Governance and Catalog.

You were able to quickly identify assets with no data quality scores, perform a data quality assessment, and get data quality rule recommendation using simple natural language prompts.

Cleanse sensitive credit card data for compliance

You're a data steward at a retail bank that provides a range of financial services, including credit cards and loans. Your bank's credit card data is stored in a specific schema in a data warehouse. For regulatory compliance, you want to ensure that the tables containing sensitive credit card data are consistent and free from common data quality issues such as missing values, duplicates, and outliers.

To achieve this goal, you can take the following approach:

- First, you discover tables from a specific schema that contain credit card details and explore the metadata of the discovered table to get an overview. To discover and explore assets, CLAIRE GPT utilizes the skills of the discovery agent.
- After you discover and explore the table containing credit card details, identify the sensitive columns in the table. CLAIRE GPT utilizes the skills of the discovery agent to identify sensitive columns based on the column names and associated glossary terms.
- Then, get recommendations for cleanse rules for the table containing sensitive columns. Accept and apply the cleanse rules.
  CLAIRE GPT utilizes the data quality agent to correct errors or inconsistencies in the table and generates a data cleansing mapplet that you can reuse to cleanse data in similar data sets.

By following this approach, you can cleanse tables containing sensitive credit card data for regulatory compliance purposes.

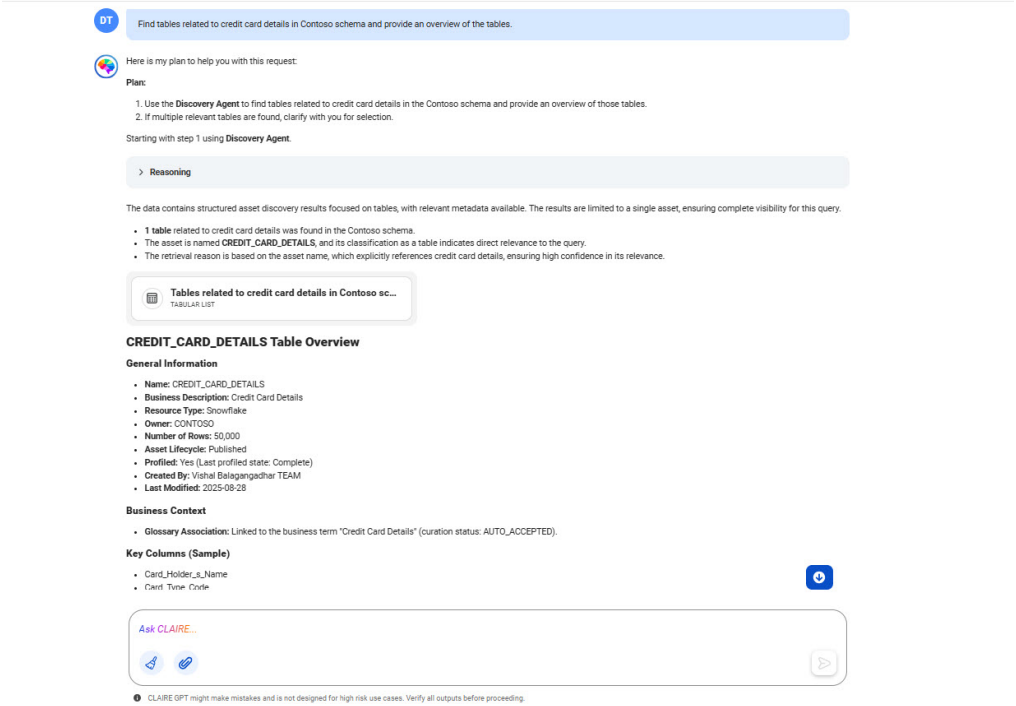

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.

2. Start a conversation to identify the tables that contain credit card details and get an overview of the table.
   Enter the following prompt:

   ```
   Find tables related to credit card details from Contoso schema and provide an overview of the tables.
   ```

   The following image shows the response displaying the table containing credit card details and a detailed overview of the table.

   To view the details of the table, click the card named **Tables related to credit card details in Contoso schema**.

   You can expand the reasoning to view the analysis process of the discovery agent.

   The following image shows the canvas with a tabular view of the tables containing credit card details:

   You can click a table name to open it in Data Governance and Catalog and see further details.

3. Assess whether this table contains sensitive data and identify the columns that contain sensitive data.
   Enter the following prompt:

   ```
   Show me the possible sensitive columns in this table
   ```

The agent identifies the sensitive columns based on the column names and its association with the glossary terms.

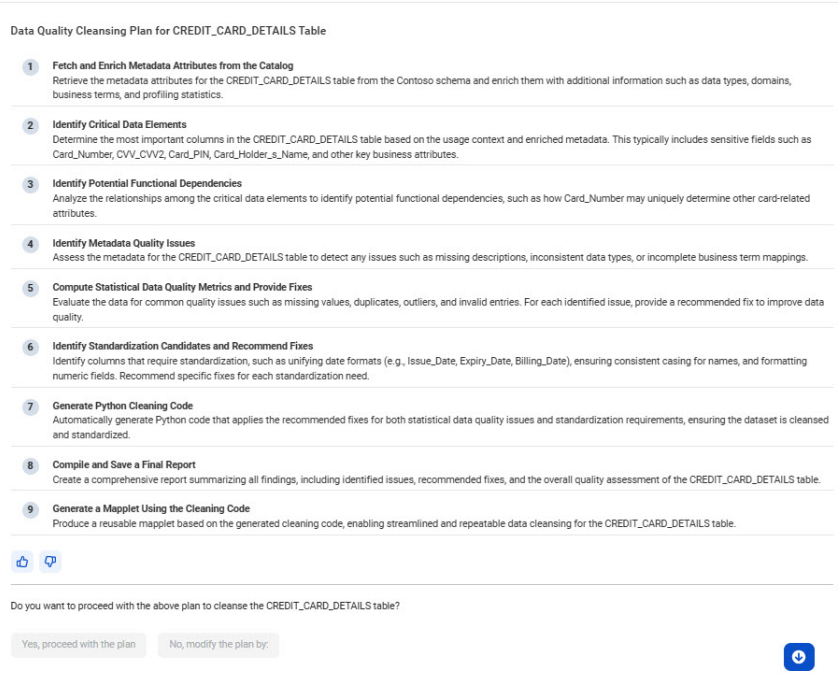

The following image shows the response displaying the sensitive columns in the table:

4. Get recommendations with a detailed plan to cleanse the data in the **CREDIT_CARD_DETAILS** table. Enter the following prompt:

   ```
   Clean CREDIT_CARD_DETAILS
   ```

   The following image shows the response displaying a detailed plan containing data quality cleanse rules for the **CREDIT_CARD_DETAILS** table:

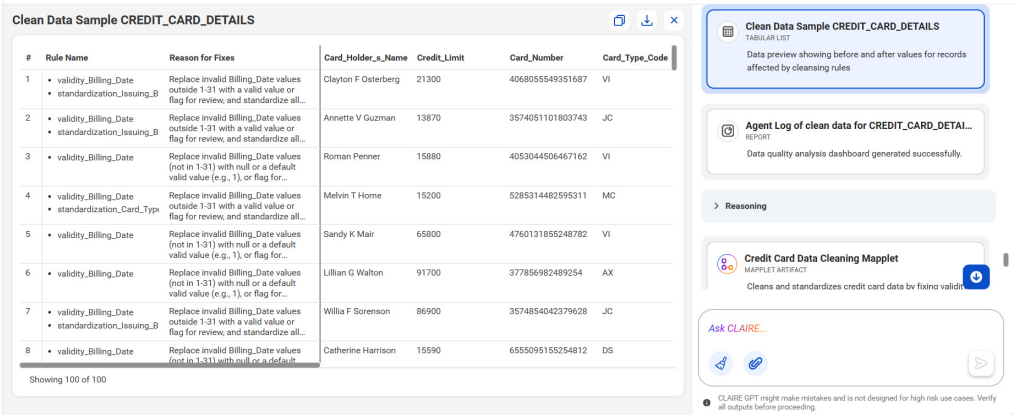

CLAIRE GPT lists detailed steps to identify critical data elements, fix data quality issues, and generate a reusable mapplet for repeatable data cleansing.

5. If you are happy with the recommended cleansing plan, click **Yes, proceed with the plan**.
   The data quality agent performs the following tasks and creates a card for each of the tasks after you proceed with the cleansing plan:
   1. Identifies critical columns in the **CREDIT_CARD_DETAILS** table.
   2. Clusters columns that are functionally dependent on each other.
   3. Fixes data quality issues such as missing values and duplicates.
   4. Generates a sample of the cleansed data.
   5. Generates a reusable mapplet.
   6. Generates a report for the cleansed data.

   You can click each card to open the canvas and view the exact details of each task.

   The following image shows a sample of the cleansed data:

You were able to quickly identify tables containing sensitive credit card details, get data quality cleanse rules recommendation, and apply the cleansing plan to the table to remediate data quality issues using simple natural language prompts.

CHAPTER 4

Data Integration

CLAIRE GPT integrates with Data Governance and Catalog to discover Data Integration assets, explore their metadata, and create ELT pipelines using Data Integration mappings.

The following table lists the Data Integration tasks that you can perform in CLAIRE GPT:

Task	Description
Data discovery	Start conversations to quickly search and discover projects and folders in Data Integration as well as mappings and mapping tasks.
Metadata exploration	Explore, view, and understand the metadata attributes of projects, folders, mappings, and mapping tasks in Data Integration.
Data transformation	Create ELT pipelines that load, transform, and integrate data. Run the pipelines as mappings in Data Integration.

Break down customers by age group

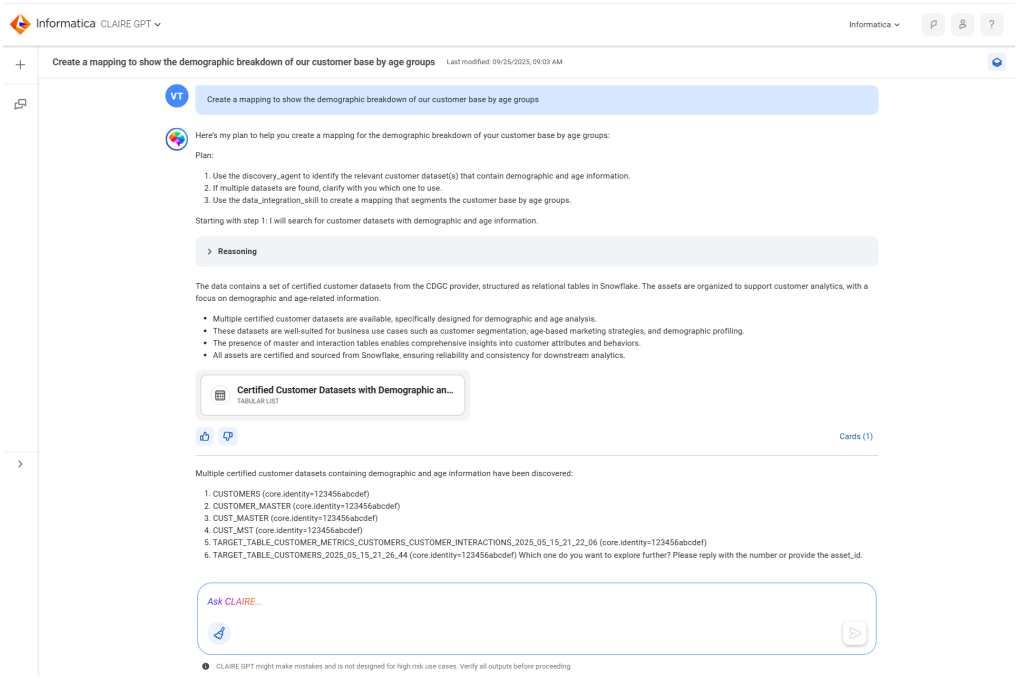

You're a data analyst at a retail company and you want to break down your customer base by age group to create targeted marketing initiatives. You can submit a single prompt to CLAIRE GPT to identify the right tables to use for the analysis, select a source table, and create an ELT pipeline as a mapping that transforms the data and writes it to a target.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation by entering the following prompt:

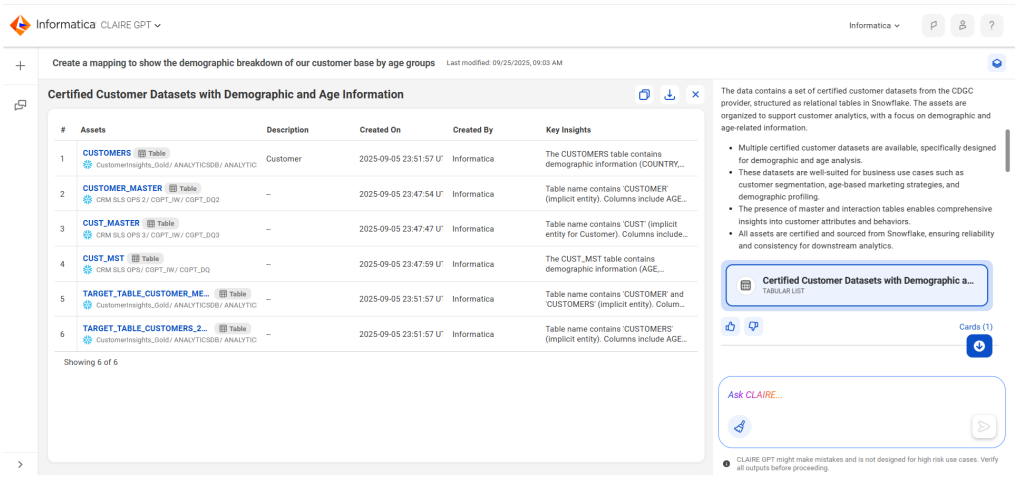

```
Create a mapping to show the demographic breakdown of our customer base by age groups
```

The following image shows the response:

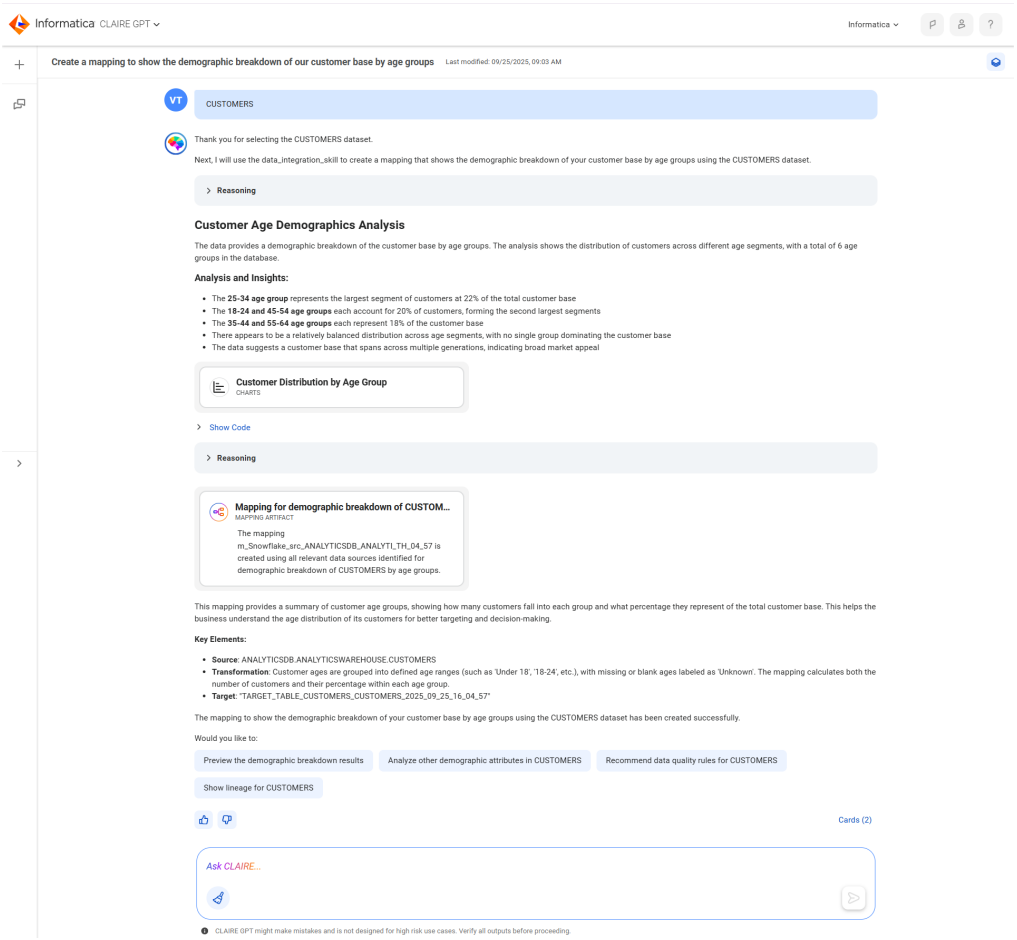

3. To view the identified source tables, select the card for the customer datasets.

   The following image shows the customer datasets:

4. To use the CUSTOMERS table to create the mapping, enter `CUSTOMERS`.

The following image shows the response:

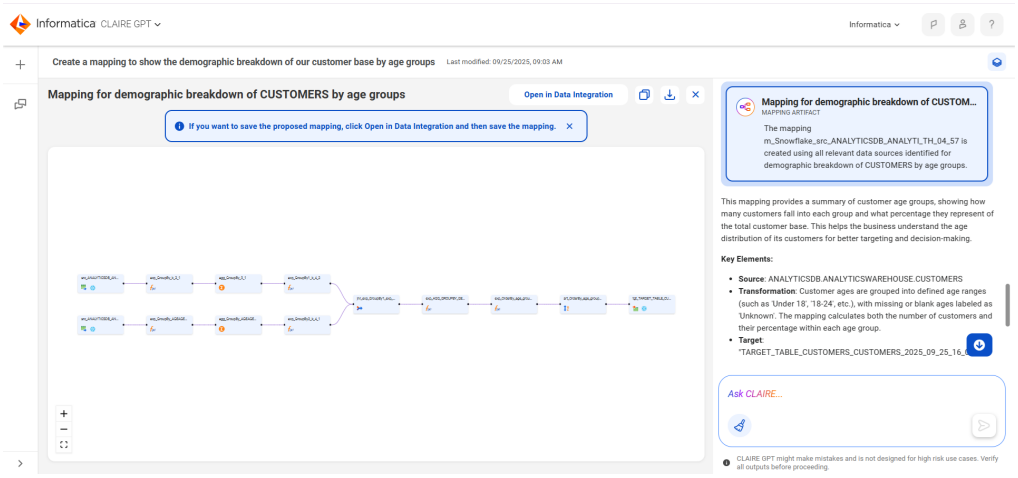

5. To view the demographic breakdown, select the card for the customer distribution by age group.

   The following image shows the customer distribution by age group:

6. To view the mapping, select the card for the mapping.

The following image shows the proposed mapping:

7. To view and save the mapping in Data Integration, select **Open in Data Integration**.

   In Data Integration, you can also edit the mapping or create a mapping task to run it. For more information, see the Data Integration help.

CHAPTER 5

MDM SaaS

CLAIRE GPT integrates with MDM SaaS to help you discover business entities, explore metadata of business entities, and explore records in business entities.

The following table describes the MDM SaaS tasks that you can perform using CLAIRE GPT:

Task	Description
Data discovery	Start conversations to quickly search and discover business entities from MDM SaaS.
Metadata exploration	Explore, view, and understand the metadata attributes of a business entity present in MDM SaaS. The metadata exploration includes details, such as business entity overview, searchable attributes, match rules, data quality rules, and survivorship rules.
Data exploration	Explore records by using field values as search criteria and then download sample data from MDM SaaS.

You can use CLAIRE GPT to perform tasks in the following MDM SaaS applications:

- Customer 360 SaaS
- Product 360 SaaS
- Supplier 360 SaaS

Generate a report about customers in California

You're a data steward at a retail company and your organization uses MDM - Customer 360 SaaS to manage customer data. You want to generate a report on the number of customers in California. You also want to create a chart showing customer loyalty status based on criteria, such as total sales that exceed $1,000, more than 50 orders, and a net margin below $3,000.

To achieve this goal, you can take the following approach:

- First, you can discover relevant customer records. To explore customer records, you can discover the Person business entity that stores customer records. To discover assets, such as Person business entity, CLAIRE GPT utilizes the data discovery capability of the discovery agent.
- After discovering the Person business entity, you can explore the metadata of the discovered business entity and get an overview of the business entity. To explore metadata of the Person business entity, CLAIRE GPT utilizes the metadata exploration capability of the discovery agent.

- To analyze customer records, you can explore field values and create a chart based on criteria, such as total sales that exceed $1,000, more than 50 orders, and a net margin below $3,000. To explore records and visualize the data, CLAIRE GPT utilizes the data exploration capability of the discovery agent.

For more information about the discovery agent, see *Discovery Agent* in Data Management Agents.

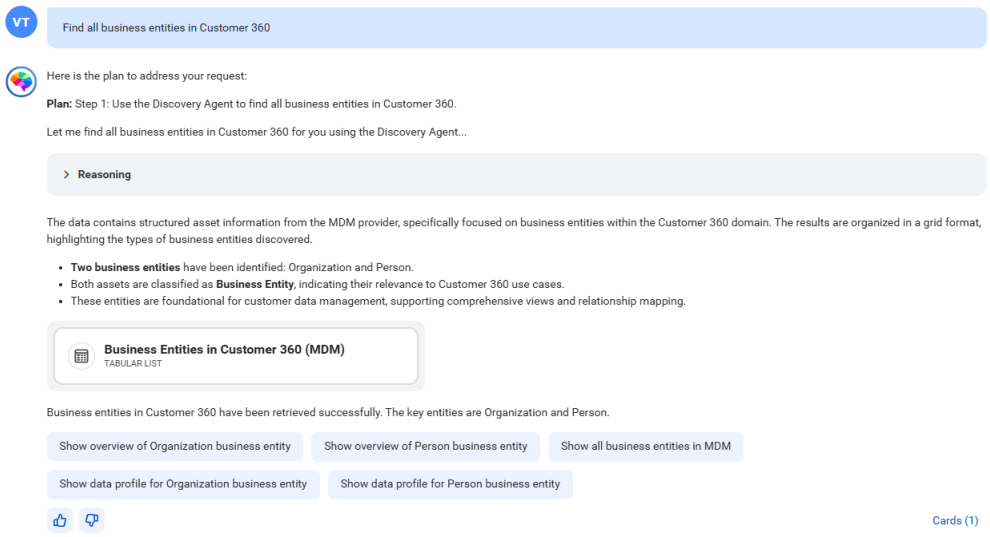

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to search for business entities in Customer 360 SaaS.

   Enter the following prompt:

   ```
   Find all business entities in Customer 360
   ```

   The following image shows the response from CLAIRE GPT displaying all business entities in Customer 360 SaaS:

   To view the business entities, click the card named **Business Entities in Customer 360 (MDM)**. CLAIRE GPT uses the discovery agent and displays the reasoning within its responses that provides a deep insight into the response generation process. You can expand the reasoning to view the query analysis process of the discovery agent.

The following image shows the canvas with a tabular view of the business entities in Customer 360 SaaS:

You can click a business entity to open it in Business 360 Console.

3. To understand more about a business entity, you can explore the metadata and take a closer look at the Person business entity.

   Enter the following prompt:

   ```
   Show an overview of Person
   ```

   You can either type the business entity name in the prompt or use @ to select the business entity from a list.

   When you type @ in the prompt text box, a list of business entities that were recently discovered based on your conversation history appears. If you continue to type the business entity name, the list shortens, and you can select a business entity from this list.

   The following image shows the response from CLAIRE GPT displaying an extensive overview of the Person business entity:

The overview includes a list of searchable attributes, match rules, survivorship rules, and data quality rules configured for the fields in the Person business entity.

Based on the response from CLAIRE GPT, you can understand the business entity and it's metadata details to further explore records in the business entity.

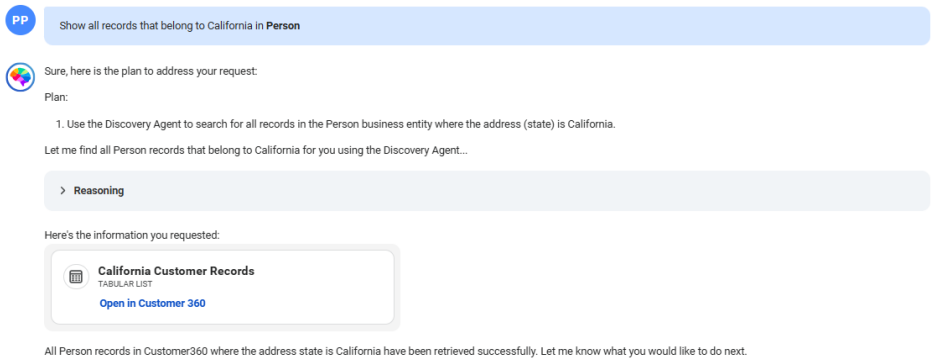

If you're looking for a different business entity, you can discover the business entity again at any point of time.

4. To explore records, specify the prompts that include values from searchable attributes.

   Enter the following prompt:

   ```
   Show all customers who live in California in @Person
   ```

   The following image shows the response from CLAIRE GPT displaying customer records from California in a card view:

   To preview records, click the card named **California Customer Records**. Additionally, you can click **Open in Customer 360** to explore records from California in Customer 360 SaaS.

The following image shows the canvas with 25 customers who live in California:

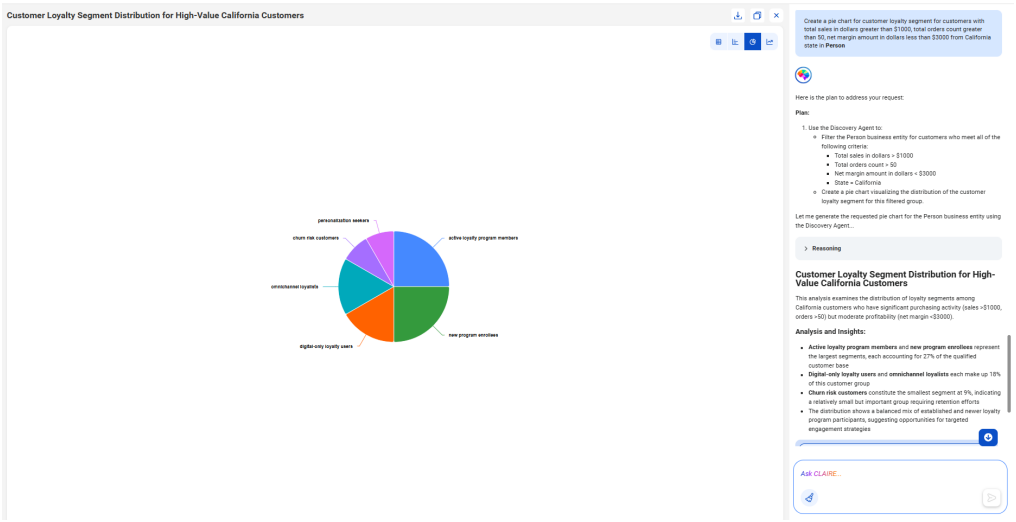

You can click a business ID to view the record in Customer 360 SaaS.

To copy and paste the sample data to a CSV file, click the **Copy** icon. To export the sample data to a CSV file, click **Download**.

5. To visualize customer loyalty based on criteria, such as total sales over $1,000, order more than 50, and a net margin below $3,000, use the following prompt:

   ```
   Create a pie chart representing customer loyalty segments for customers from
   California in Person who have total sales exceeding $1,000, order counts above 50,
   and a net margin amounting to $3,000.
   ```

   The following image shows the response from CLAIRE GPT displaying a pie chart to visualize the customer loyalty segments for customers in California:

You can also switch between the table, bar chart, and line chart.

You can export the data and use it for further analysis. You can also tweak the prompts until your goal is achieved.

CHAPTER 6

Data Marketplace

CLAIRE GPT integrates with Data Marketplace to help you discover categories, explore the data collections in the categories and view the orders for the data collections.

The following table lists the Data Marketplace tasks that you can perform in CLAIRE GPT:

Task	Description
Data discovery	Quickly search and discover data in your organization. Start conversations in natural language to quickly search for data collections relevant to your business use case in Data Marketplace. You can also discover categories, consumer accesses, and orders.
Metadata exploration	Explore, view, and understand the metadata attributes of a category or data collection. This includes the properties of the category or data collection.

Fetch data for the quarterly sales report

You are an intern in the Darmstadt office of a food and beverage company. You are asked to create the quarterly sales report for Germany. You seek the data that you need to compile the report.

The data that you need to create the report is available in Data Marketplace.

To achieve this goal, you can take the following approach:

- First, you can discover the relevant categories in Data Marketplace. For this, you can look for categories that relate to sales.
- After you determine the appropriate category, you can explore it to identify the data collection that you need to create the report.

These tasks utilize the data discovery skill of the discovery agent.

For more information about the discovery agent, see *Discovery agent*.

Following this approach, you can discover the data that you need to create the quarterly sales report.

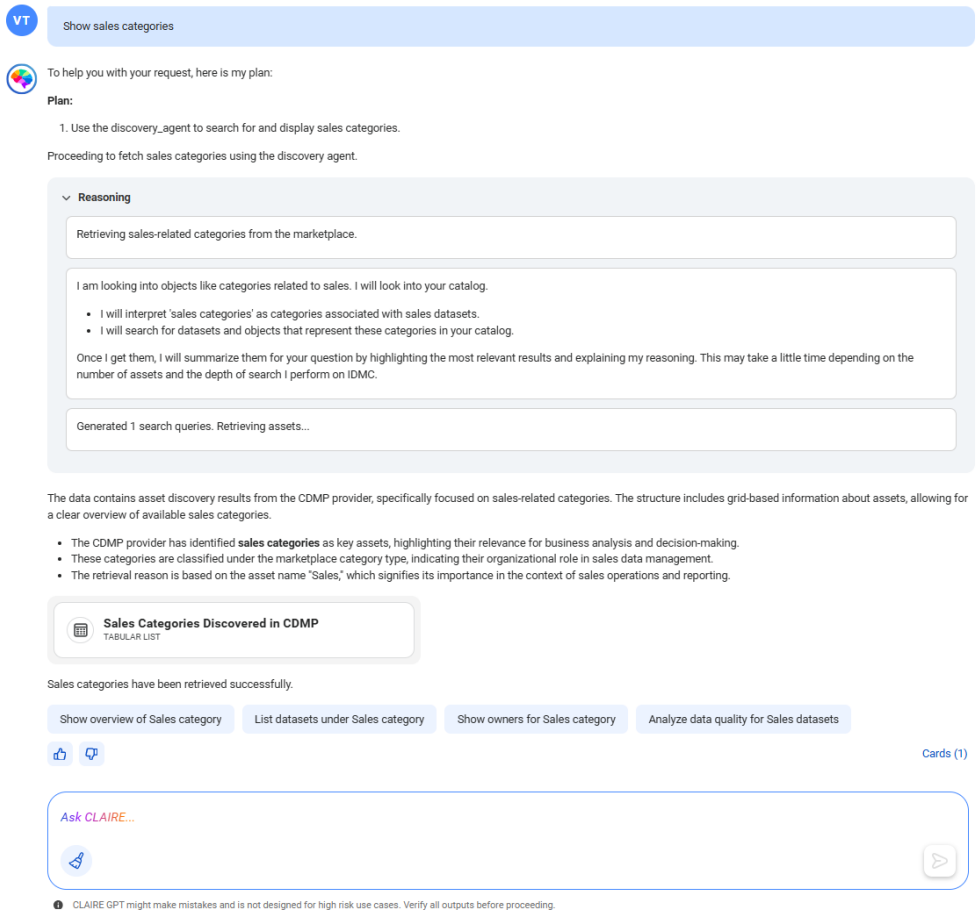

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to search for categories related to sales.

   Enter the following prompt:

   ```
   Show sales categories
   ```

The following image shows the response of CLAIRE GPT to the prompt, displaying a summary of the categories that were discovered:

CLAIRE GPT retrieves all the categories that contain 'sales' in their name or description. To view the list of categories, click the card named **Sales Categories Discovered in CDMP**.

The following image shows the canvas with a list of categories that relate to sales:

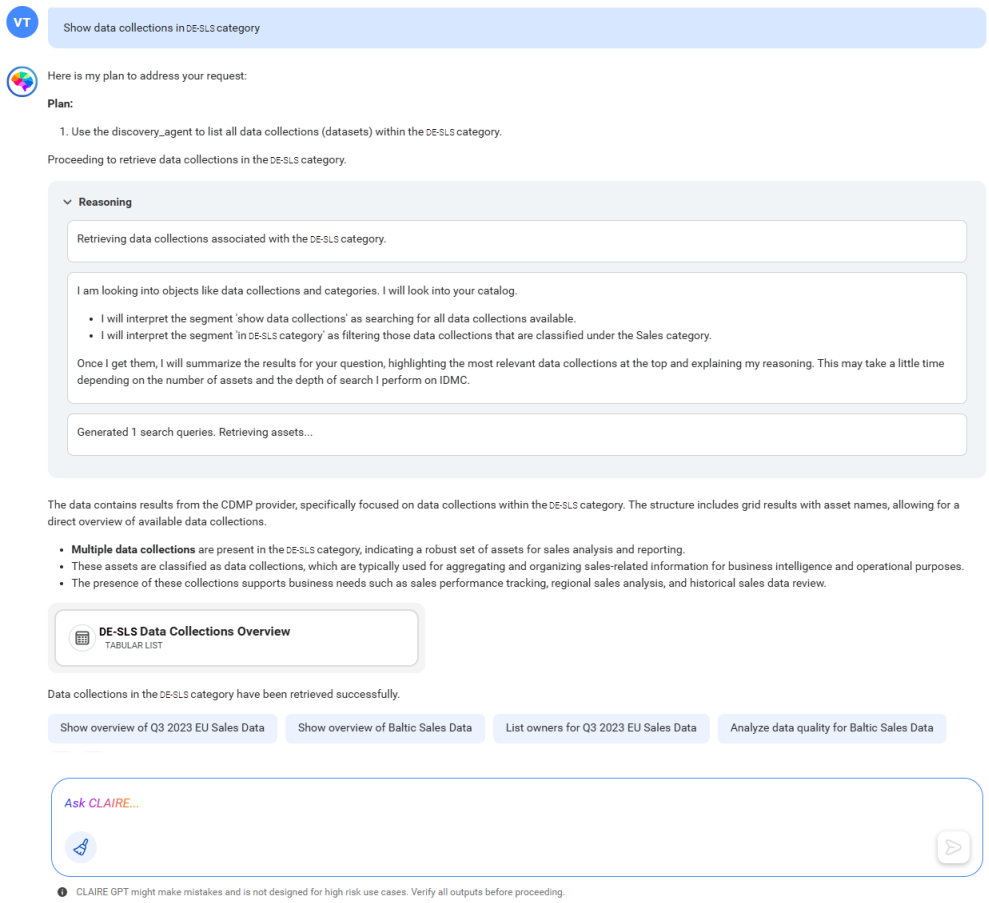

You can click a category name to see the details in Data Marketplace.

From the list of categories, you identify that the DE-SLS category contains the data for sales in the German region.

3. Now, you can view the data collections in the DE-SLS category.
Enter the following prompt:

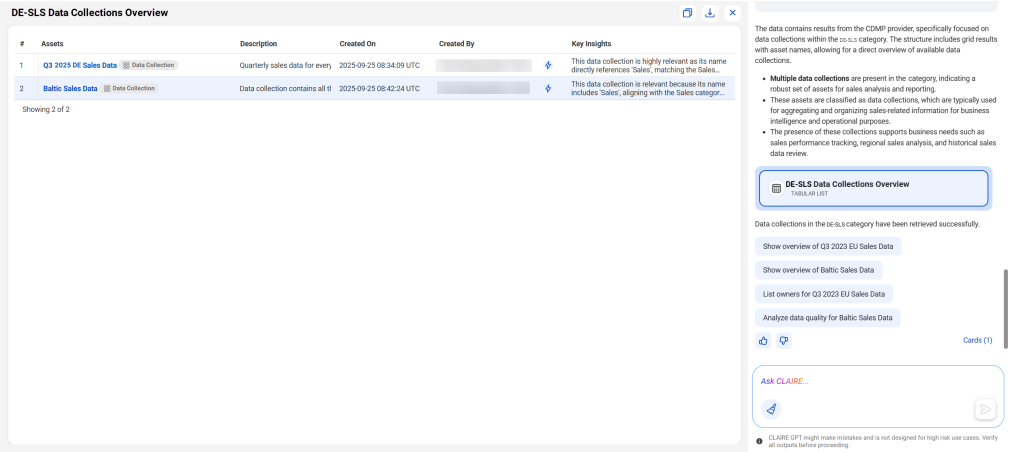

```
Show data collections in DE-SLS category
```

The following image shows the response of CLAIRE GPT to the prompt, displaying the data collections in the DE-SLS category:

CLAIRE GPT retrieves all the data collections in the DE-SLS category. To view the data collections in the category, click the card named **DE-SLS Data Collections Overview**.

The following image shows the canvas with a tabular view of data collections in the 'DE-SLS' category:

You can click a data collection name to see the details in Data Marketplace.

From the response, you identify that the Q3 2025 DE Sales Data data collection contains the information that you seek. You can open the data collection in Data Marketplace and place an order to gain access to it.

You were able to quickly identify data of interest using simple natural language prompts.

CHAPTER 7

Leverage multiple agents for complex goals

Leverage the diverse range of data management agents and their specialized skills to successfully accomplish a complete goal or objective. The unique skills of these agents combine to ensure a more efficient and effective outcome for complex use cases.

Let's look at the following use case that demonstrates how you can use specialized skills of multiple agents to quickly analyze and remediate patient data for healthcare reporting.

Analyze patient data for healthcare reporting

You're a data steward in a healthcare organization responsible for maintaining high-quality patient data. Your goal is to ensure that the data is accurate, complete, and ready for reliable healthcare reporting. To achieve this goal, you want to analyze the data to identify errors such as duplicate or missing medical record numbers (MRNs), missing or future-dated birth dates, and invalid gender values.

Here's the approach you can follow:

- First, you discover the PATIENT table that contains patient information. CLAIRE GPT uses the data discovery skill of the discovery agent to discover the table.
- After the discovery of the table, you can view the data profile of the table to assess the number of patient records in the table that contain duplicate or missing MRNs, missing or future birth dates, and non-standard gender values. CLAIRE GPT uses the data profiling skill of the data quality agent to check for these data quality issues.
- You can then identify and analyze the exact patient records that contain duplicate or missing MRNs, missing or future birth dates, and non-standard gender values. CLAIRE GPT uses the data exploration skill of the discovery agent to identify and analyze these patient records from the PATIENT table.
- You can now generate a mapping which detects all patient records with duplicate MRNs and other data quality issues so that you can address these issue for improved data accuracy. CLAIRE GPT uses the data integration skill of the data integration agent to create a mapping that you can save and run in Data Integration.
- Next, find out how you can modify and run the mapping that you created. CLAIRE GPT uses the product documentation research skill of the product help agent to answer product help queries.

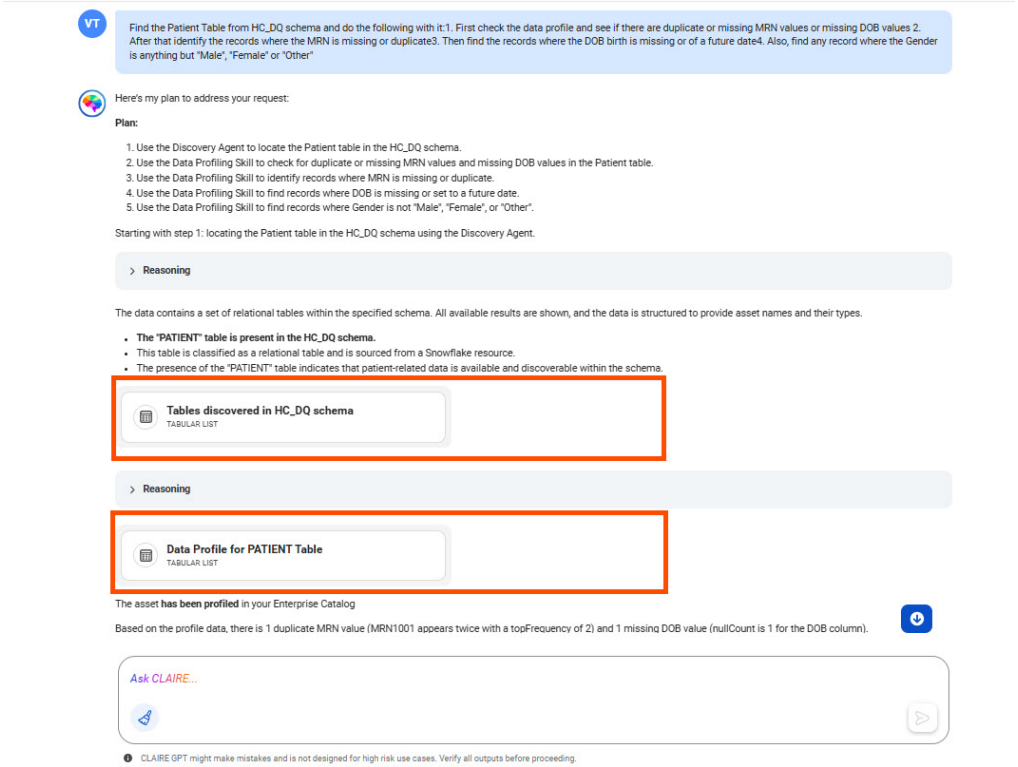

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.

2. You can enter a single prompt to search for a table with patient information and to identify patient records containing duplicate or missing MRNs, missing or future-dated birth dates, and invalid gender values.
   Enter the following prompt that includes multiple instructions:

   ```
   Find the Patient Table from HC_DQ schema and do the following with it:
   1. First check the data profile and see if there are duplicate or missing MRN values
   or missing DOB values
   2. After that identify the records where the MRN is missing or duplicate
   3. Then find the records where the DOB birth is missing or of a future date
   4. Also, find any record where the Gender is anything but "Male", "Female" or "Other"
   ```

   The following image shows a part of the response highlighting the tables discovered in the HC_DQ schema and the data profiling insights on the PATIENT table:

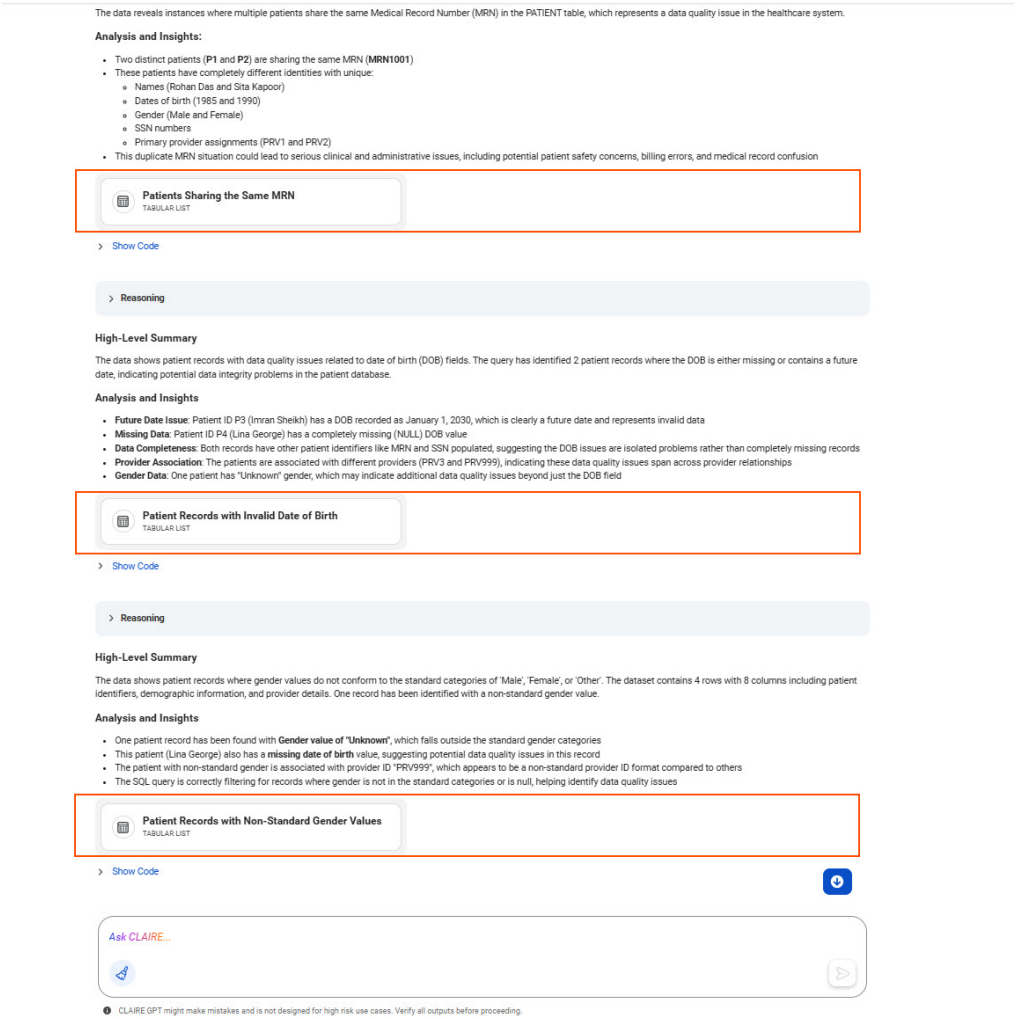

3. Click the card named **Data Profile for PATIENT Table** to see if there are patient records containing duplicate or missing MRNs, missing or future birth dates, and non-standard gender values. You can also view the key insights on these findings.

The following image shows the canvas with the data profiling information of the PATIENT table, displaying the identified data quality issues as key insights:

	name	dataType	valueCount	nullCount	distinctCount	duplicateCount	topValue	topFrequency	average
1	PATIENT_ID	VARCHAR	4	0	4	0	P1	1	NaN
2	MRN	VARCHAR	4	0	3	1	MRN1001	2	NaN
3	FIRST_NAME	VARCHAR	4	0	4	0	Imran	1	NaN
4	LAST_NAME	VARCHAR	4	0	4	0	Das	1	NaN
5	DOB	DATE	4	1	3	1		1	NaN
6	GENDER	VARCHAR	4	0	3	1	Male	2	NaN
7	SSN	VARCHAR	4	0	4	0	111223333	1	NaN
8	PRIMARY_PROVIDER	VARCHAR	4	0	4	0	PRV1	1	NaN

4. To identify and analyze the patient records with data quality issues, you can open the card generated for each data quality issue. Each card is accompanied by a detailed analysis and insight on the sample patient records and the data quality issue in those records.
The following image shows the response highlighting different cards for the three data quality issues:

For example, you can open the card named **Patients Sharing the Same MRN** to view the sample patient records that share the same medical record number in the PATIENT table.

The following image shows the canvas with a tabular view of the patient records that share the same MRN value in the PATIENT table:

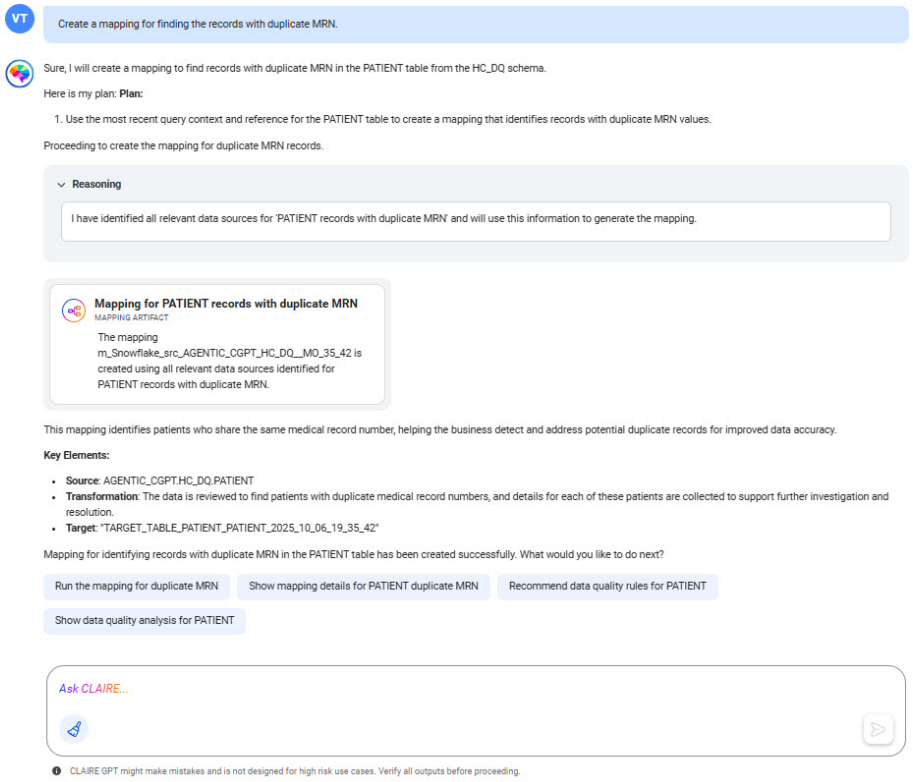

Optionally, to copy and paste the sample data to a CSV file, click the **Copy** icon. To export the sample data to a CSV file, click **Download**.

5. Create a mapping to identify all patient records with duplicate MRNs.
   Enter the following prompt:

   ```
   Create a mapping for finding the records with duplicate MRN.
   ```

The following image shows the response for creating the mapping:

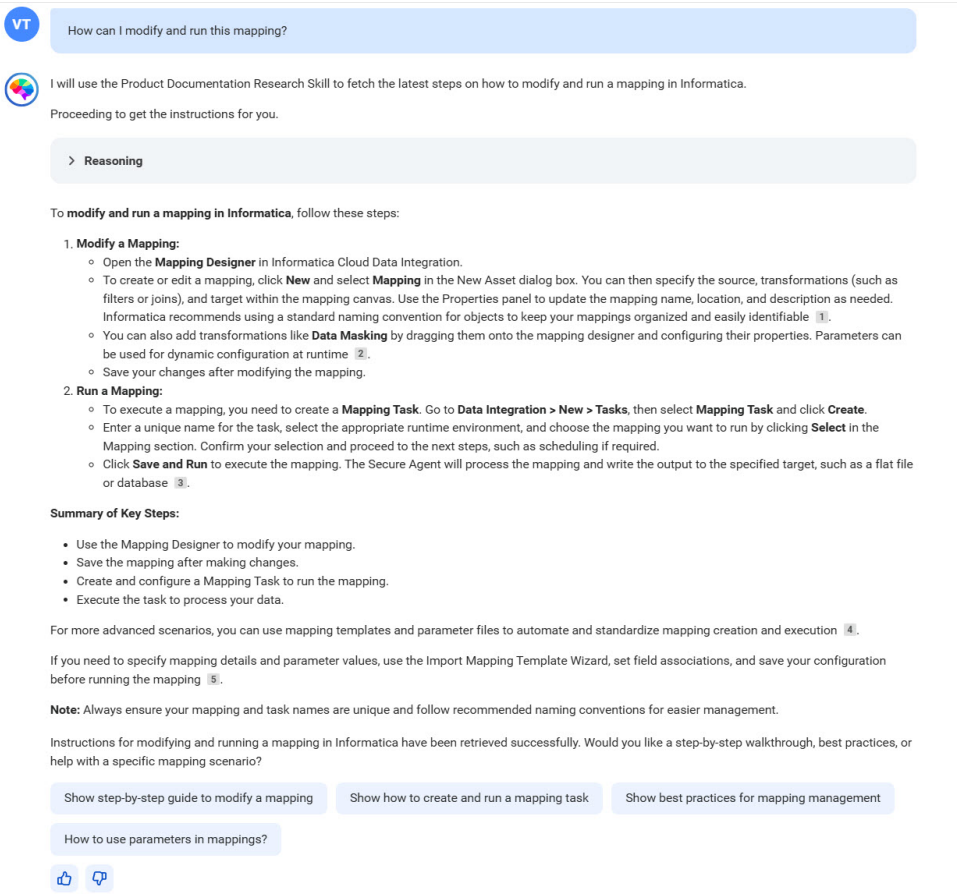

Optionally, open the card named **Mapping for PATIENT records with duplicate MRN** to view the proposed mapping.

The following image shows the mapping that CLAIRE GPT proposes to detect patient records with duplicate MRNs:

To view and save the proposed mapping, select **Open in Data Integration**. In Data Integration, you can also edit the mapping or create a mapping task to run it.

6. You can ask CLAIRE GPT how you can modify and run the mapping that it proposed.
   The following image shows the response to the product help question, along with suggested prompts for next actions that you can take:

CHAPTER 8

Quick reference

Quickly refer to helpful tips and information to increase productivity in your tasks on CLAIRE GPT.

See sample prompts

Type # to see sample prompts and quickly get started with your conversations.

Access your previous prompts

Avoid scrolling through a long list of prompts in your conversations by using the ∧ or ∨ navigation keys to recall previous prompts.

Clear conversation memory

Clear the context of your conversations and start a conversation afresh by typing the prompt `Clear memory` or clicking the **Clear conversation memory** button.

Clarify security concerns

For any questions related to the security of CLAIRE GPT, simply enter the following prompt: `Is CLAIRE GPT secure?`

Intelligent asset suggestions

Type @ to use CLAIRE GPT's intelligent prompt completion to quickly refer to assets, artifacts, users, and user groups that are already referenced in your conversation.

Pin conversations

If you have an unfinished conversation, pin your conversation to resume it later without trying to remember where you stopped.

Get started with CLAIRE GPT
