Preface

Read *Data Quality Agent* to learn how to use natural language prompts to quickly assess and diagnose your data, receive recommendations for data quality rules for assets that don't have rules associated with them, cleanse your data, and generate rule specifications from rule descriptions in a file or prompt.

CHAPTER 1

Data quality agent

The data quality agent can assess and diagnose the quality of your assets, summarize and profile your data, identify outliers, and recommend data quality rules to detect discrepancies in your data. It can also generate cleansed data, extract rule descriptions in natural language from files or prompts, and convert them into data quality rule specifications in Data Quality.

The data quality agent performs tasks autonomously, makes decisions, and interacts with large language models through specific skills to achieve a specific goal. The agent uses human intervention in case of ambiguity.

You can access these capabilities through CLAIRE GPT, where the data quality agent processes your requests and runs data quality tasks.

Data quality agent skills

The data quality agent has specific skills that can help you achieve data quality goals in your organization with intelligent autonomy.

The data quality agent has the following skills:

- Data quality assessment. Identifies and analyzes assets based on data quality scores, statuses, or any specific data quality criteria. You can perform data profiling on demand and identify outliers in your data. For more information, see Chapter 2, “Data quality assessment” on page 7.
- Data quality diagnosis. Diagnoses the data quality of assets to gain additional insights into your assets. For more information, see Chapter 3, “Data quality diagnosis” on page 11.
- Data quality rule recommendation. Recommends data quality rules for assets that don't have rules associated with them. You can accept the recommended rules to identify data quality failures and to ensure that the data meets high standards of quality. For more information, see Chapter 4, “Data quality rule recommendation” on page 13.
- Data quality cleanse. Generates cleansed data for the files you upload or data sets you specify from a catalog. For more information, see Chapter 5, “Data quality cleanse” on page 17.
- Data quality rule generation. Extracts business rules from an uploaded file or prompt that contains data quality rule descriptions in natural language, sample data, or a specified catalog source, and converts them into data quality rule specifications in Data Quality. For more information, see Chapter 6, “Data quality rule generation” on page 21.

Prerequisites

The following table describes the prerequisites for various skills of the data quality agent:

Skills	Prerequisite
All skills	In Administrator, enable the Data Governance and Catalog service for the runtime environment that your organization uses.
Data quality cleanse	The mapplet that CLAIRE GPT generates contains a Python transformation. To use the mapplet in a mapping, verify that Python is installed on the Secure Agent machine. As an organization administrator, install Python on the machine where you installed the Secure Agent. Verify that the Python installation directory includes the Pandas and PyArrow libraries. To configure Python, perform the following tasks: 1. In Administrator, go to **Runtime Environment**. 2. Select a Secure Agent and enable the **IDMC Data Gateway Service** option. 3. In **Custom Configuration**, set the **python_enabled** value of the **APP_CFG** property to `true`. If you configure a version of Python that is different from the one that Informatica includes in the Secure Agent installation, specify the `idmc_dgs_pythonHome` parameter value as `<INFA_HOME>/ext/python/bin/<python_executable>`. For more information about how to install and configure Python on a Secure Agent machine, see *Transformations* in the Data Integration help. For more information about mappings, see *Mappings* in the Data Integration help.
Data quality rule recommendation, data quality rule generation	Enable IDMC metadata in Metadata Command Center. This configuration prevents the data quality agent from generating duplicate rules and rule recommendations. The configuration also ensures that the data quality agent generates rule recommendations only from the rule specifications in Data Quality. For more information about how you can enable IDMC metadata in Metadata Command Center, see the *Administration* help in Metadata Command Center.

CHAPTER 2

Data quality assessment

Discover and analyze data sets using data quality criteria, data quality scores, or data quality status with the help of the data quality assessment skill of the data quality agent.

You can use CLAIRE GPT to assess data quality in the following ways:

View catalog summary

View a summary of the data in your catalog. The summary includes data types, statistics, and the number of null and unique values and can help you identify outliers in your data.

If the data profile of the requested data set is not available in the catalog, CLAIRE GPT performs on-demand data profiling of the data elements in the data set to return the data summary.

Profile your data

You can profile data from a file that you upload. You can upload a CSV or Microsoft Excel file up to 25 MB. CLAIRE GPT can profile up to 10,000 rows and 50 columns of data from the file that you provide.

When you ask CLAIRE GPT to profile data from a file that you upload, you can filter by rows, focus on selected columns, or combine both to target specific records. By filtering, you get faster and more focused results without having to profile an entire data set.

You can also use CLAIRE GPT to analyze a subset of a data set.

The following list shows some examples of how you can use CLAIRE GPT to profile your data:

- Profile a subset of rows in a file that you upload. To filter by rows, describe the records that you want to include based on the column values. For example, you can ask CLAIRE GPT to profile B2B transactions in North America in Q1 2024.
- Profile a subset of columns in a file that you upload. To filter by columns, name the columns that you want to profile. For example, you can ask CLAIRE GPT to profile North America transactions in Q1 2024 using only the pricing and margin columns.
- Profile a sample row within a data set, analyze consistent and repeatable subsets of a data set, or a representative subset of a data set. For example, you can ask CLAIRE GPT to profile the 10 most recent transactions or the 500 largest transactions by amount in a file that contains financial data.

Assess the data quality of systems and business data sets

Explore and assess the data quality of systems and business data sets from a business perspective. For example, you can ask to view the data quality rules created by a stakeholder, or rules created in the last quarter.

Note: CLAIRE GPT displays scores only for the default data quality dimensions.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Governance and Catalog data quality assessment journey in CLAIRE GPT.

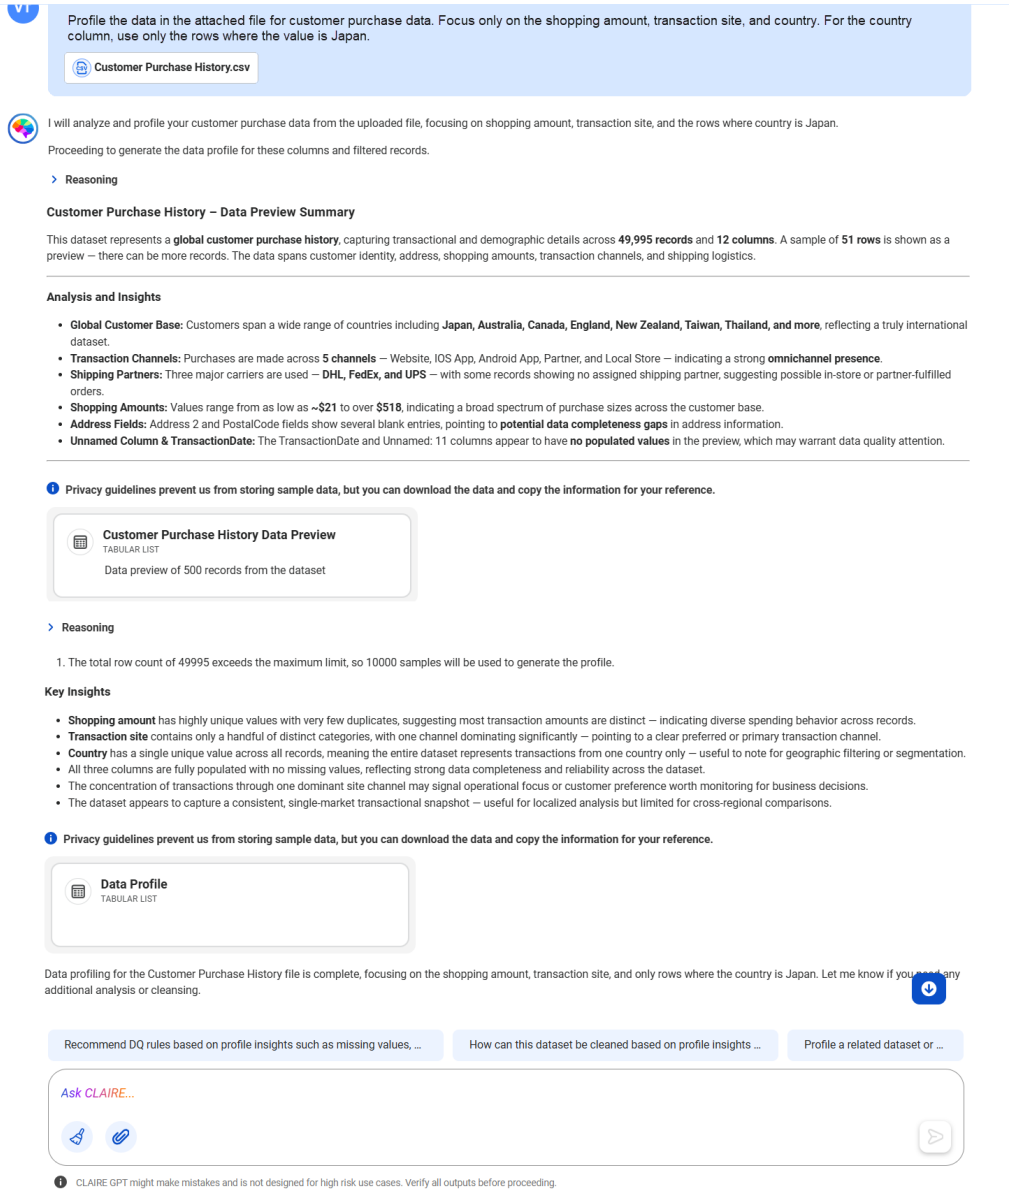

As a data steward in a marketing agency, you want to find the purchase history of Japanese customers to design a promotional campaign. To do this, you analyze the historical data for all your customers across the globe.

To achieve the goal, perform the following steps:

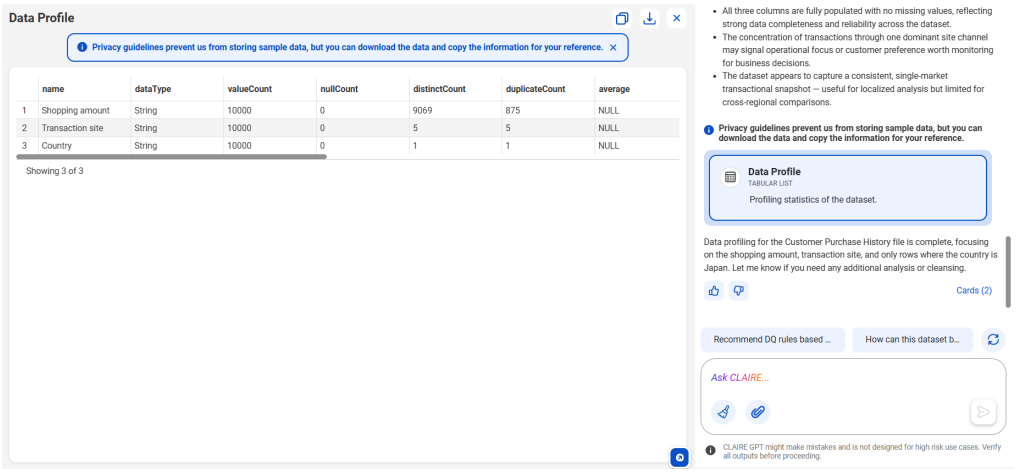

1. Log in to CLAIRE GPT.
2. Start a conversation to identify and profile the data for Japanese customers by focusing on their purchase patterns.
   Enter the following prompt:

   ```
   Profile the data in the attached file for customer purchase data. Focus only on the shopping amount, transaction site, and country. For the country column, use only the rows where the value is Japan.
   ```

The following image shows the response displaying the data profile for the purchase patterns of Japanese customers:

3. To view the detailed data profile for the customer table, click the card named **Data Profile**. The following image shows the canvas of the data profile of the customer data:

Using the data quality assessment skill of the data quality agent, CLAIRE GPT found the subset of data that provides you information on the purchase patterns of Japanese customers.

CHAPTER 3

Data quality diagnosis

You can identify the reasons behind poor data quality scores in the assets you discover with the help of the data quality diagnosis skill of the data quality agent.

You can get insights on the data elements and dimensions that led to poor scores, the data quality rules that contributed to poor scores, or any records that violated data quality rules. CLAIRE GPT uses the data quality diagnosis skill of the data quality agent to diagnose the data elements and rules that led to the poor scores.

When you ask questions to diagnose the data quality of your assets, the response includes lineage insights. The lineage insights show how upstream and downstream assets in the lineage of an asset affect the data quality scores.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Governance and Catalog data quality diagnosis journey in CLAIRE GPT.

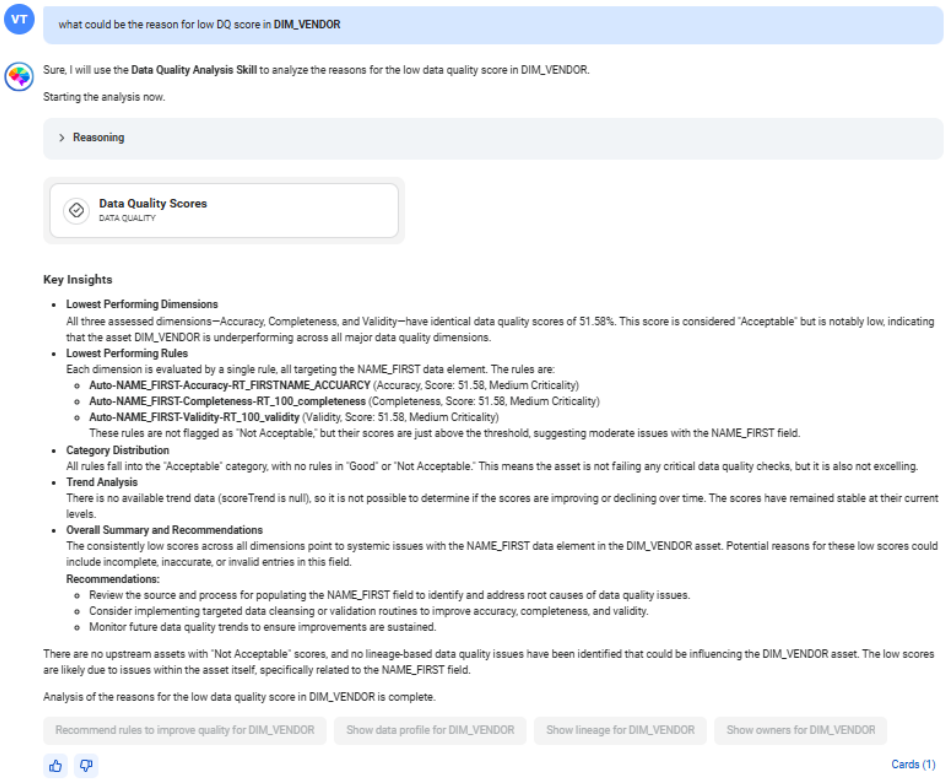

As a data steward in a retail organization, you want to identify the reasons why the vendor data you discovered has poor data quality scores. You want to get insights on the data elements and dimensions that led to poor scores, or any records that violated data quality rules.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to get a data quality diagnosis.
   Enter the following prompt:

   ```
   What could be the reason for low DQ score in DIM_VENDOR?
   ```

The following image shows the response that provides reasons for poor data quality scores in the vendor information table and recommendations on data quality score improvements:

The data diagnosis skill of the data quality agent identifies the reasons for poor quality scores in DIM_VENDOR data. The agent also shows key insights to low performing dimensions, rules, category distribution, trend analysis, overall summary and recommendations for remediating poor data quality scores in DIM_VENDOR data.

CHAPTER 4

Data quality rule recommendation

Establish data quality standards for data sets in your catalog, create rules for the data elements in the data sets, and ensure that the data meets the established data quality standards with the help of the data quality rule recommendation skill of the data quality agent.

You can ask CLAIRE GPT to assess a data set and recommend suitable data quality rules. To recommend rules, the data quality agent considers the business context from your prompt to identify the critical data elements within the data set. After the agent identifies the critical data elements, it recommend data quality rules that are contextual to the identified data elements.

Optionally, you can ask CLAIRE GPT to recommend additional rules beyond those that are contextual to the identified data elements. To recommend additional rules, the data quality agent considers the data profile or a sample row of the data set.

The data sets for which you want CLAIRE GPT to recommend the rules might not have associated rule templates. If there are no data quality rule templates associated with the data sets in Data Governance and Catalog, CLAIRE GPT recommends rules directly from the rule specifications in Data Quality. If no rule specifications are available in Data Quality, CLAIRE GPT can generate new rules. For more information about how CLAIRE GPT generates data quality rules, see Chapter 6, “Data quality rule generation” on page 21.

You can get rules for data sets that don't have manually created or associated rules. You can then use the recommended rules to establish data quality criteria for the data set. By defining the criteria, you set standards for the data based on various dimensions such as accuracy, completeness, and consistency. You can accept or reject rule recommendations. If you accept a rule recommendation, a rule occurrence is then created for the data elements in Data Governance and Catalog, where you can review your data for discrepancies.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Governance and Catalog data quality rule recommendation journey in CLAIRE GPT.

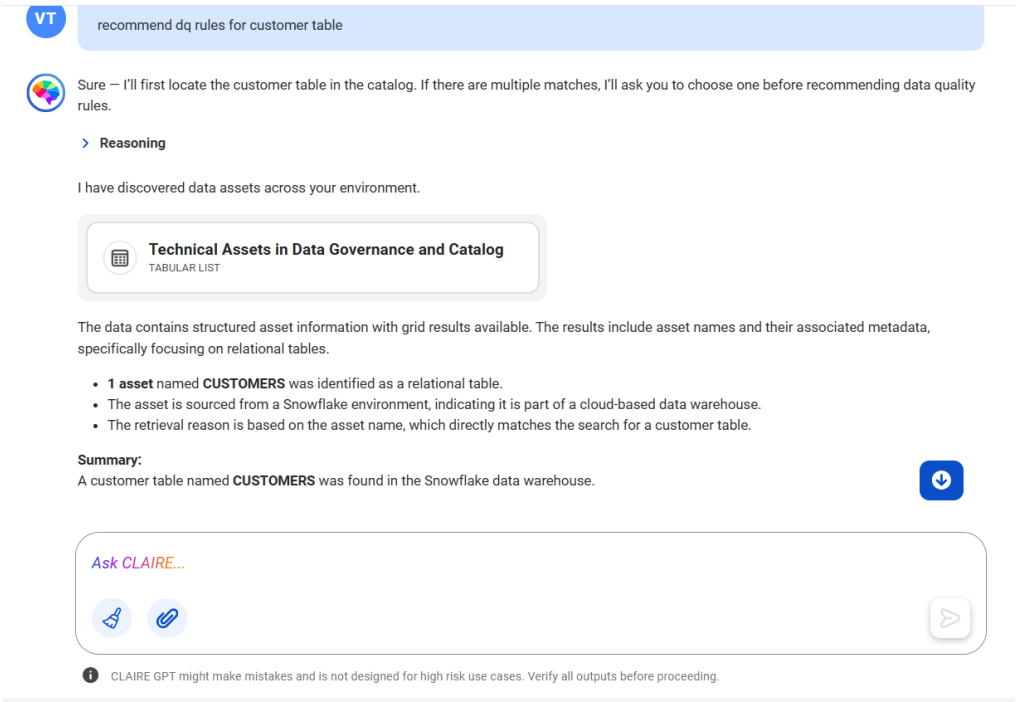

As a data steward in a retail organization, you want to establish data quality criteria of customer data in your organization. The customer data currently does not have associated data quality rules.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to get data quality rule recommendations.
   Enter the following prompt:

   ```
   Recommend dq rules for customer table.
   ```

The following image shows the response displaying the card that lists the data sets that relate to the phrase `customers`:

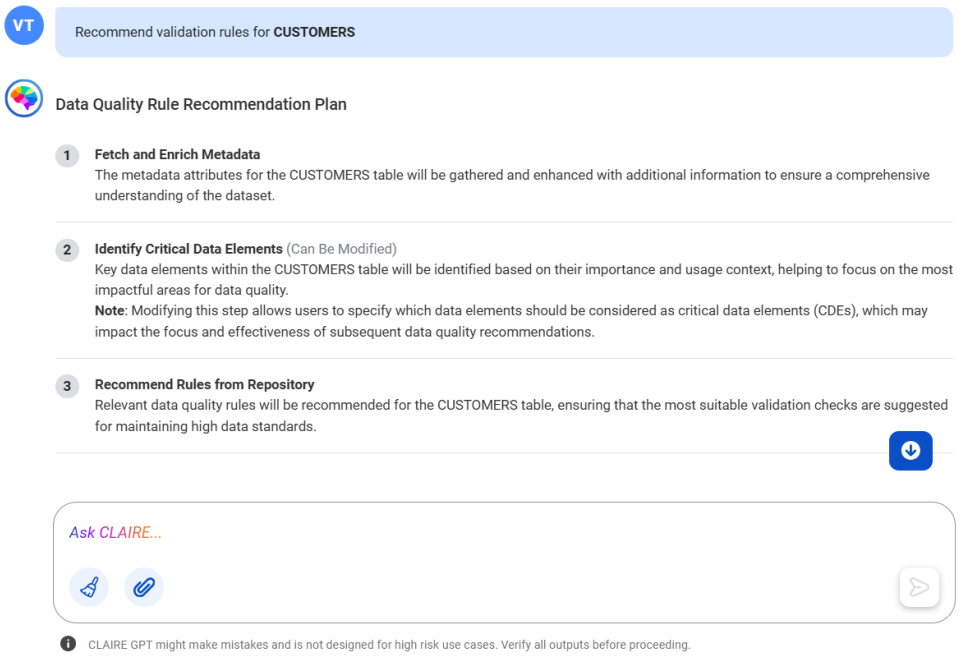

3. The discovery agent identifies that the CUSTOMERS data set from your catalog matches the search query.
4. Ask CLAIRE GPT to recommend data quality rules for the CUSTOMERS data set.
   Enter the following prompt:

   ```
   Recommend validation rules for CUSTOMERS
   ```

   CLAIRE GPT outlines the plan it will employ to recommend the rules for the data set.

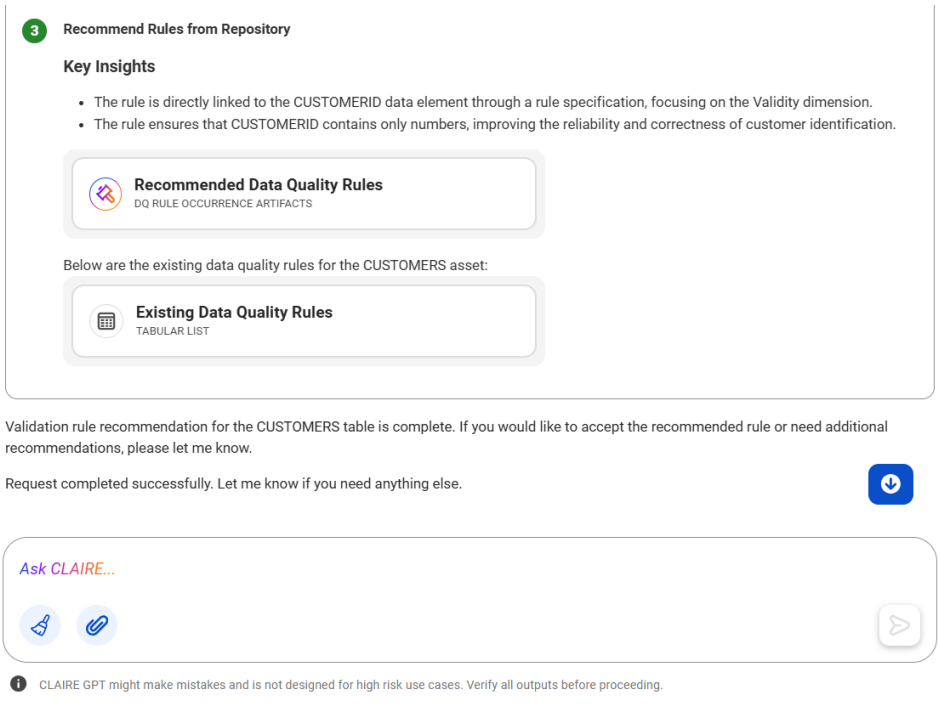

The following image shows the response displaying the plan devised by CLAIRE GPT to recommend data quality rules:

5. If the outlined plan looks good to you, you can ask CLAIRE GPT to proceed with it.
   Enter the following prompt:

   ```
   Yes, proceed with the plan
   ```

   The following image shows the response displaying the card that lists the data quality rules that are recommended for the CUSTOMERS data set:

6. To preview all the rules, click the **Recommended Data Quality Rules** card.
   You can click the recommended data quality rule card to see the details in Data Governance and Catalog. You can also download the data quality rules in `.csv` format.
7. Optionally, you can ask CLAIRE GPT to accept or reject the recommendations.

   If you accept the recommended rules, CLAIRE GPT creates a rule occurrence in Data Governance and Catalog.

Using the data quality rule recommendation skill of the data quality agent, CLAIRE GPT has recommended data quality rules for the table that contains customer data.

CHAPTER 5

Data quality cleanse

Generate cleansed data from a file you upload or a data set in your catalog that contains unclean data with the help of the data quality cleanse skill of the data quality agent.

CLAIRE GPT runs a profile on your data to assess its quality and structure, suggests cleansing rules for your data, and provides a preview of your data with a recommended cleansing plan. After you approve the plan, the agent identifies key data elements, detects missing or incorrect values, standardizes data formats, generates cleansed data, and creates mapplets based on the generated cleansed data. You can use mapplets to create a reusable data cleansing process for similar data sets in the future.

When you ask CLAIRE GPT to cleanse data from the file you provide, you can upload a CSV or Microsoft Excel file up to 25 MB.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Governance and Catalog data quality cleanse journey in CLAIRE GPT.

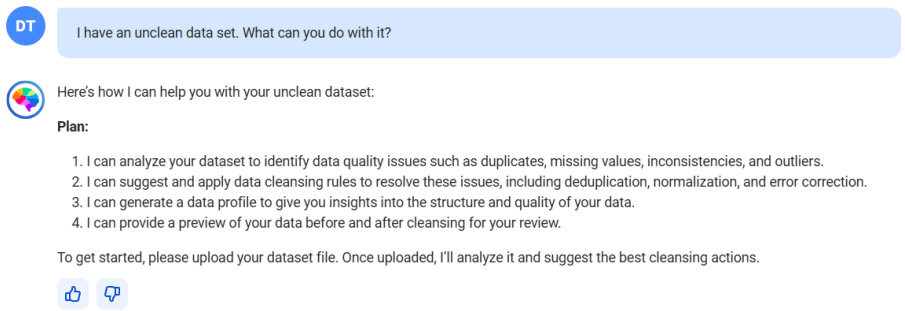

As a data steward working in banking and financial services, you want to ensure that the credit card records that you are working on are updated with the correct activation status.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to identify what the data quality agent can do with an unclean data set.
   Enter the following prompt:

   ```
   I have an unclean data set. What can you do with it?
   ```

   The following image shows the response displaying a detailed plan on how the agent can help you cleanse your data.

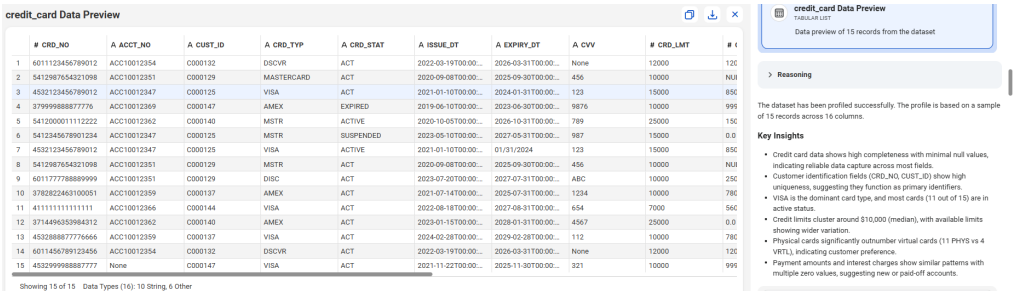

CLAIRE GPT lists the steps in a plan to analyze your data set, identify data quality issues in the data, apply data cleanse rules to resolve the data quality issues, generate a profile to give you insights on the structure and quality of data, and preview your data before and after cleansing.

3. Upload the `credit_card.xlsx` file that contains the credit card records.
   The response includes a preview and a profile of the data.

   The following image shows the response displaying a detailed analysis and insights on the data along with a preview of the data in the `credit_card.xlsx` file.

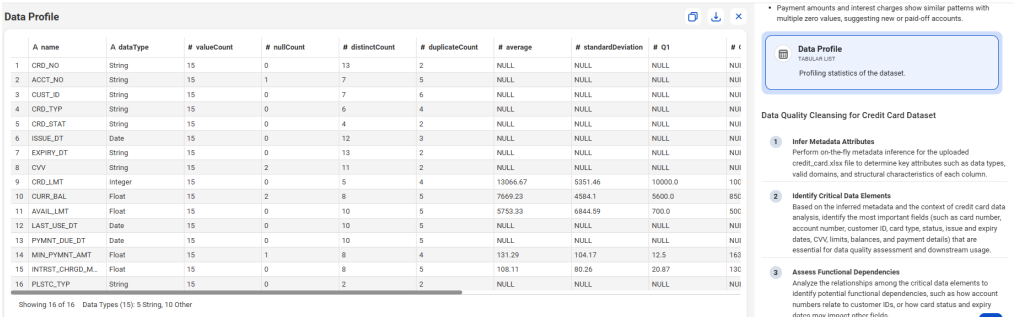

4. Click the **credit_card Data Preview** card to quickly preview 15 records in the table. You can download the table as a CSV file or copy the table to another file.
   The following image shows the canvas with a data preview of the credit card information.

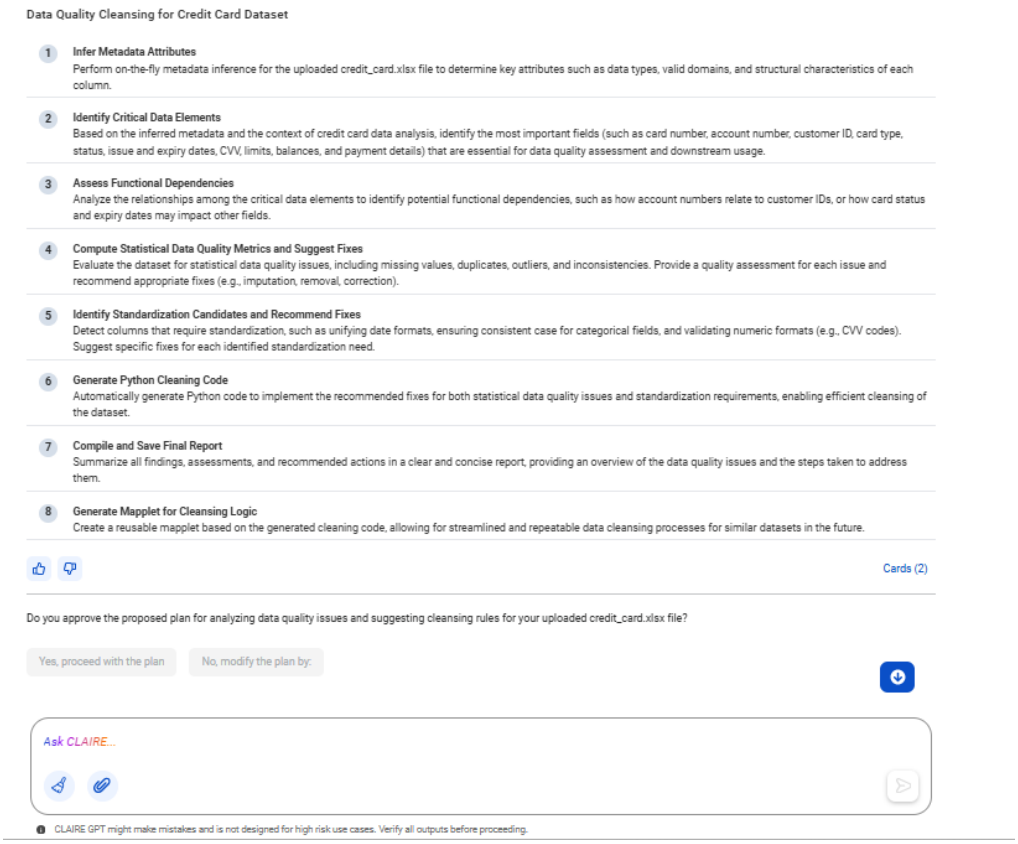

5. To view the profile of the credit card data, click the **Data Profile** card.

The following image shows the canvas with profiling statistics of the credit card data.

You can download the table as a CSV file or copy the table to another file.

6. After the agent profiles your data, the agent suggests cleansing rules for your data.
The following image shows the proposed plan for analyzing data quality issues and suggesting cleansing rules for your data.

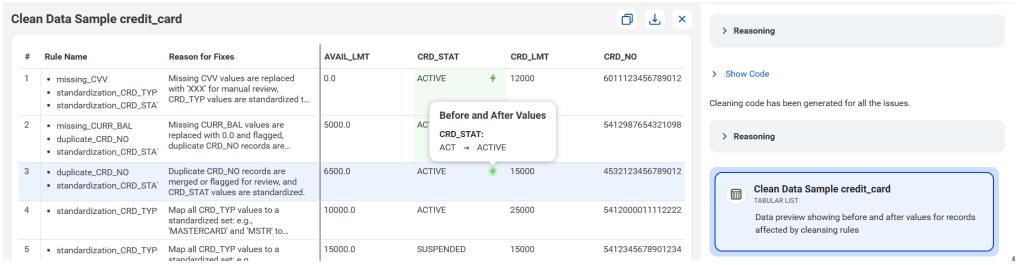

7. If you are happy with the proposed cleansing plan, enter the following prompt:

   ```
   Yes, proceed with the plan
   ```

   The agent identifies critical columns in the `credit_card.xlsx` file, assesses functional dependencies among critical data elements, updates data with the correct activation status, computes data quality metrics, suggests remediations, and generates cleansed data and a mapplet.

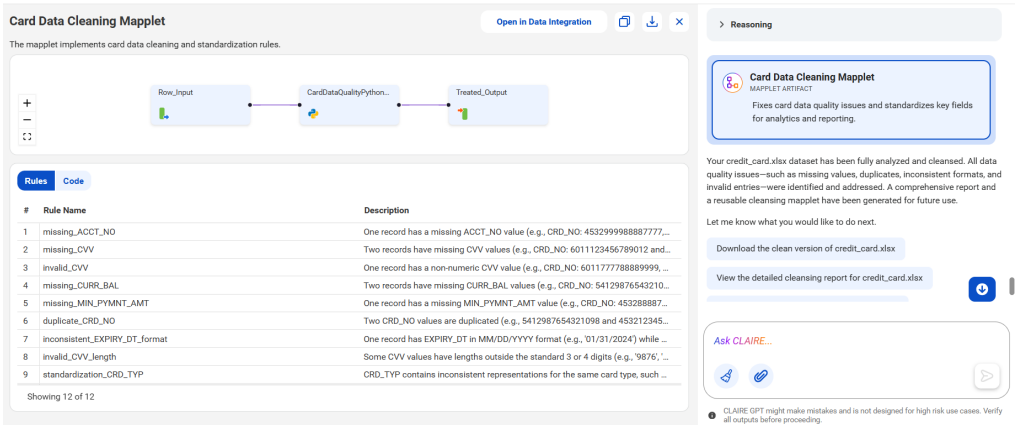

The following image shows a sample of the cleansed data.

8. To view the generated cleansing rules report, click the **Agent Log of clean data for credit_card** card.
The following image shows the canvas with a view of the clean data log.

9. To view the generated mapplet, click the **Card Data Cleaning Mapplet** card.
The following image shows the canvas with a view of the data cleansing mapplet that the agent generated.

You can view the mapplet in Data Integration, and reuse the mapplet to cleanse data in similar data sets. You can download the mapplet as a PNG file or copy the mapplet to another file.

Using the data quality cleanse skill of the data quality agent, CLAIRE GPT has analyzed the credit card data, profiled the data, and generated cleansed data and a mapplet.

CHAPTER 6

Data quality rule generation

Extract business rules from an uploaded file or prompt that contains data quality rule descriptions in natural language, sample data, or a specified catalog source, and converts them into data quality rule specifications in Data Quality with the help of the data quality rule generation skill of the data quality agent.

If you upload a CSV or Microsoft Excel file that contains data quality rule descriptions in natural language, or the file contains sample data, or if you specify a catalog source from which to retrieve a data set, CLAIRE GPT uses the data quality rule generation skill of the data quality agent to automatically extract business rules and convert them into data quality rule specifications.

When you ask CLAIRE GPT to generate rule specifications for a data set, CLAIRE GPT analyzes the critical data elements of the data set to generate rule specifications.

To ensure that consistent and standardized reference data is used for generating the data quality rules, you can ask CLAIRE GPT to use a dictionary. When CLAIRE GPT generates a data quality rule specification and can't find the specified dictionary in Data Quality, it automatically creates the dictionary for the rule specification.

After you allow the agent to publish the rules, you can see the rule specifications in the project folder you specify. By default, the rule specifications are saved in the CLAIRE folder within the CLAIRE project in Data Quality. In the agent log, you can get a summary of the generated rules, distribution of rules across different data quality dimensions, and a list of the rules that were not generated. If you chose to not test the rules that were generated, the log indicates the same.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Governance and Catalog data quality rule generation journey in CLAIRE GPT.

As a data analyst in a financial organization, you are responsible for ensuring the accuracy of the country codes for the regions in which your organization operates. You have a file that contains rule descriptions, and you ask the agent to generate rule specifications from the rule descriptions.

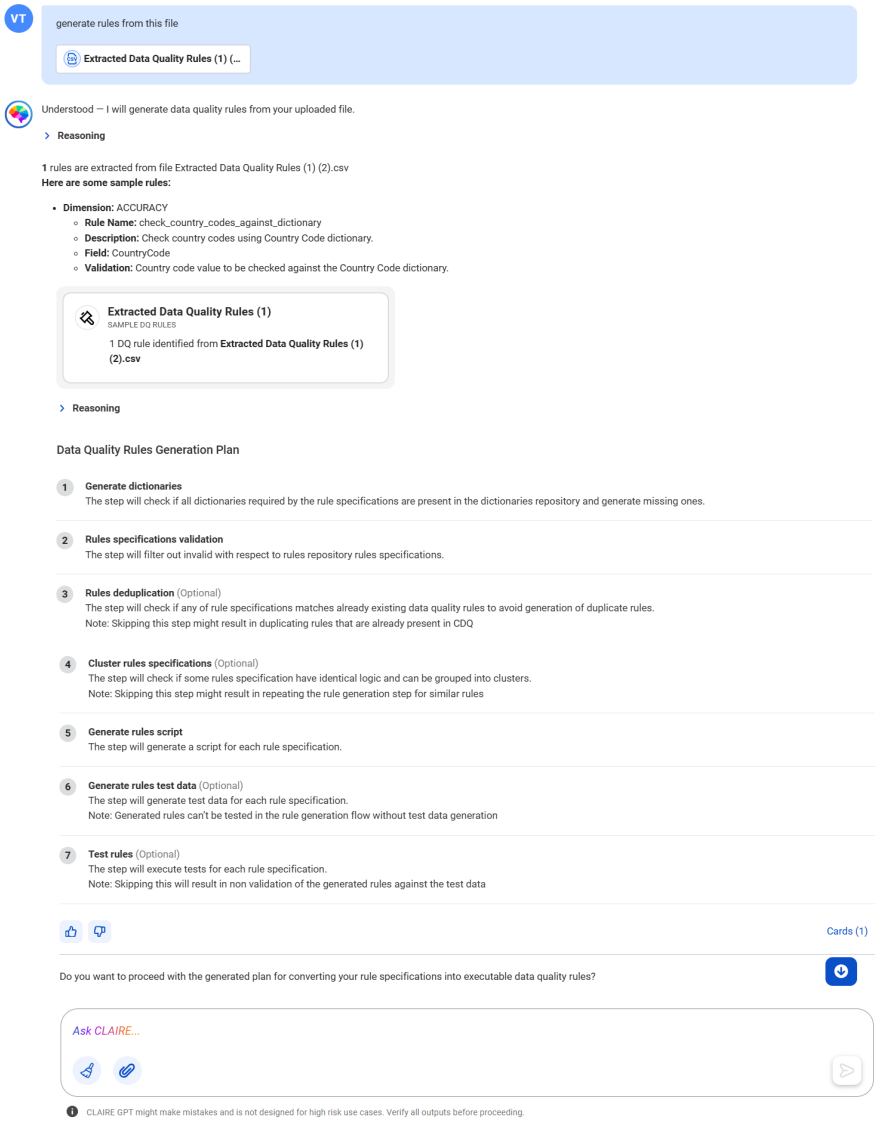

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Upload a file that contains the rule descriptions, and start a conversation to identify how the data quality agent can generate data quality rules from the rule descriptions saved in a file.
   Enter the following prompt:

   ```
   Generate rules from this file.
   ```

CLAIRE GPT indicates the optional steps within the plan. By default, CLAIRE GPT executes all steps, but you can prompt it to skip the optional ones.

The following image shows the response displaying a detailed plan on how the agent can generate rules from a file:

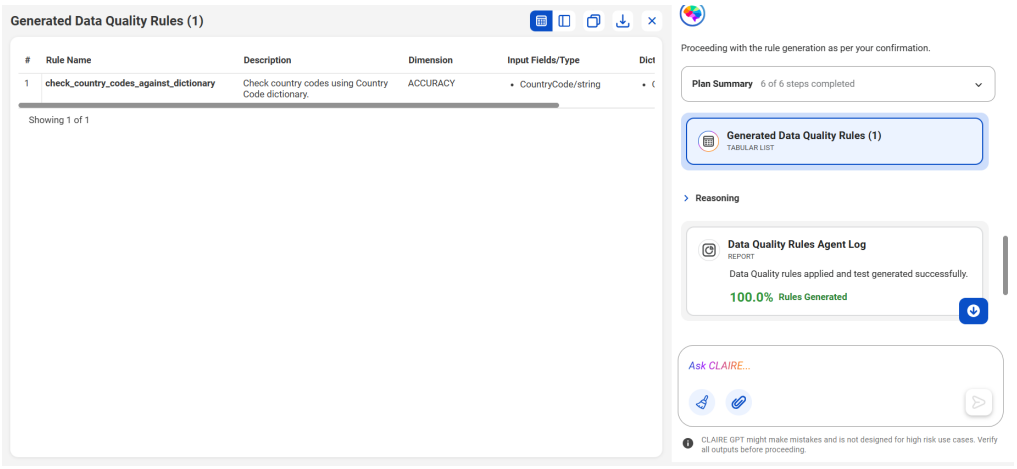

3. If you are happy with the proposed rule generation plan, enter the following prompt:

   ```
   Yes, proceed with the plan.
   ```

   The data quality rule generation skill of the agent validates the rules and checks for existing rules with the same logic in Data Quality. The agent groups rules with logically identical descriptions into clusters and creates a single rule for each cluster in the file. If CLAIRE GPT can't find the specified dictionary in Data Quality, it automatically creates the dictionary for the rule specification.

   The agent then generates rule scripts and corresponding test data for each rule, executes tests for each rule, and provides a comprehensive summary of the generated rule specifications.

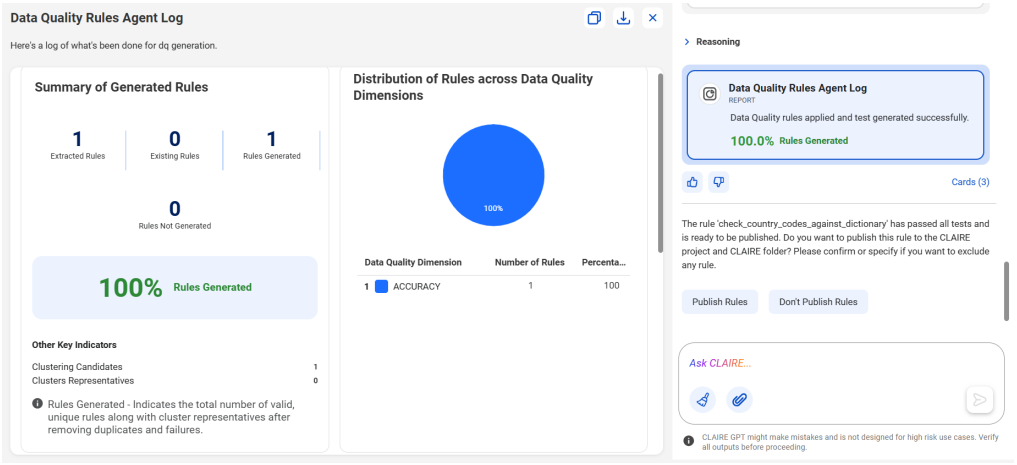

The following image shows the data quality rules that the agent generated from the uploaded file.

To see the details of each generated rule specification, you can switch to **Detail View**.

You can download the data as a CSV file or copy the data to another file.

4. To view a summary of the rule specifications that the agent generated, click the **Data Quality Rules Agent Log** card.
   The following image shows the canvas with a summary of the rule specifications that the agent generated.

5. If you are happy with the rule specifications that the agent generated and want to publish them in Data Quality, enter the following prompt:

   ```
   Publish Rules
   ```

   To view the published rule specifications, click the **Published DQ Rules** card. If a published rule fails a test, the **Published DQ Rules** card indicates that.

   You can open the rule specifications in Data Quality and view them in the CLAIRE folder within the CLAIRE project.

Using the data quality rule generation skill of the data quality agent, CLAIRE GPT has analyzed the rule description in an uploaded file, extracted rules from the file, generated rule specifications, and published them in Data Quality.
