Preface

Read *Discovery Agent* to learn how to easily discover data assets, explore metadata of assets, and explore source data across Intelligent Data Management Cloud services.

CHAPTER 1

Discovery agent

The discovery agent helps you quickly identify relevant, trusted, and compliant data assets across Intelligent Data Management Cloud services.

The discovery agent performs tasks autonomously, makes decisions, and interacts with large language models through specific skills to achieve a specific goal. This agent can perform data discovery, metadata exploration, and data exploration.

You can access these capabilities through CLAIRE GPT or CLAIRE Copilot, where the discovery agent interprets your query, searches across your data landscape, and completes your request.

Discovery agent skills

The discovery agent has specific skills that can achieve data management goals with intelligent autonomy.

The discovery agent has the following skills:

- Helps you quickly and easily find assets. For more information, see Chapter 2, “Data discovery” on page 6.
- Helps you search and explore the metadata of assets. For more information, see Chapter 3, “Metadata exploration” on page 16.
- Helps to understand the quality and shape of your source data to identify data anomalies. For more information, see Chapter 4, “Data exploration” on page 28.

CHAPTER 2

Data discovery

You can use the discovery agent to quickly and easily find assets across Intelligent Data Management Cloud services.

With billions of assets across services, it can be time-consuming to discover the data that you need. You can start conversations and quickly search and discover assets relevant to your business use case and discover semantically similar assets across services.

You can discover relevant assets based on the user persona, such as a business user or a technical user. If you log in as a business user and search for assets, CLAIRE GPT displays business assets before technical assets.

You can further analyze and manage data based on responses from CLAIRE GPT.

The discovery agent integrates with the following Intelligent Data Management Cloud services to help you discover assets:

- Data Governance and Catalog
- Data Integration
- Data Marketplace
- MDM SaaS

Discover assets from the catalog

You can use the discovery agent to search and discover assets in your catalog with CLAIRE GPT.

After extracting metadata from the required source systems into Data Governance and Catalog, you can use CLAIRE GPT to search for business and technical assets, view relationships between assets, view the stakeholders that are responsible for the assets, and so on.

Note: When you use data discovery to find assets in the catalog, critical data elements appear first in the response.

Open large search results in Data Governance and Catalog

For broader discovery prompts that return large result sets, the conversation canvas in CLAIRE GPTdisplays a sampled list of 25 ranked assets for immediate exploration and quick context. To view more assets from your search results list without losing context, click **Open in Data Governance and Catalog**. As you seamlessly transition from your CLAIRE GPT conversation to the full catalog view in Data Governance and Catalog, you can perform bulk curation, reporting, or further data governance activities without losing context.

When you navigate from the search result set in CLAIRE GPT to Data Governance and Catalog, you may notice differences in asset ordering and ranking. CLAIRE GPT evaluates intent and ranks its 25 displayed assets using data quality scores, conversation history, and glossary relationships. CLAIRE GPT translates your conversational prompt into a Domain-Specific Language (DSL) query. On the other hand, Data Governance and Catalog runs the translated search query objectively against the catalog index and displays assets that match the literal interpretation of the query, without knowledge of the conversation context. For further conversational reasoning or AI analysis on the full data set, export the results from the catalog and upload the file back into CLAIRE GPT for targeted follow-up analysis.

Prerequisites

Before you perform data discovery tasks in CLAIRE GPT for Data Governance and Catalog, ensure that you perform the following tasks:

- Enable the Data Governance and Catalog service for the runtime environment that your organization uses. For more information, see *Runtime Environments* in the Administrator help.
- Verify that you extracted metadata from the required source systems into the catalog. For more information, see *Asset Discovery* in the Data Governance and Catalog help.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Governance and Catalog data discovery journey in CLAIRE GPT.

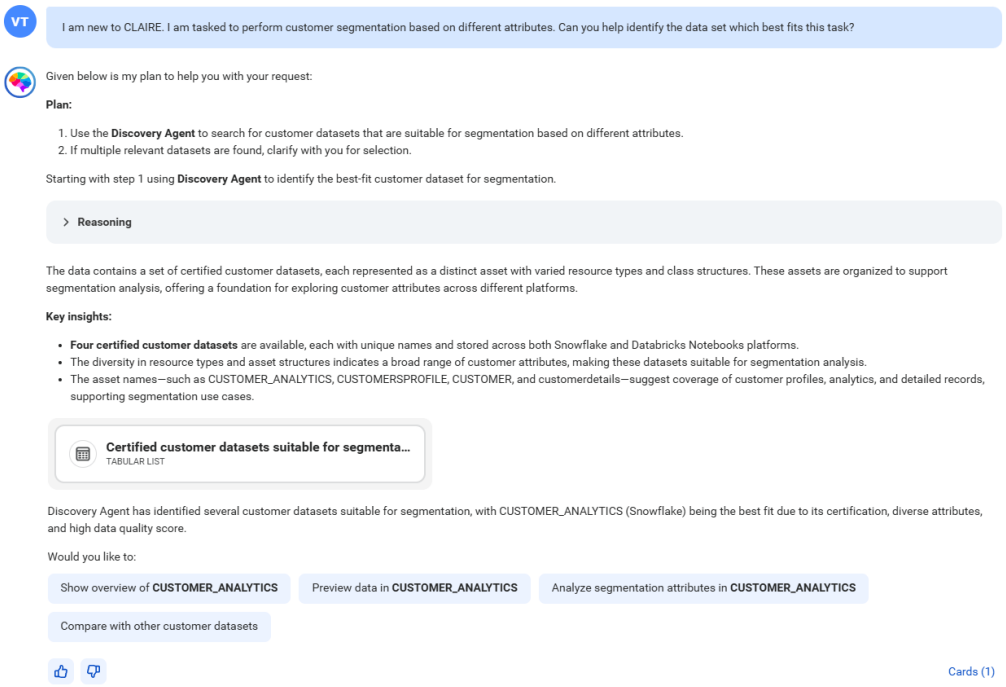

You're a data analyst, and you want to segment customers based on different customer attributes. Your organization catalogs its customer data in Data Governance and Catalog. You want to look at customer data sets in the catalog to identify information that you can use in your analysis.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to help you identify the data set which is most suitable to perform customer segmentation.
   Enter the following prompt:

   ```
   I am new to CLAIRE. I am tasked to perform customer segmentation based on different attributes. Can you help identify the data set which best fits this task?
   ```

   The following image shows the response displaying a set of certified customer data sets that can be used for customer segmentation:

Using the data discovery skill, the discovery agent has found four certified data sets that can be used to segment customers.

To view the data sets, click the card named **Certified customer datasets suitable for segmentation analysis**.

The following image shows the canvas with a tabular view of the customer data sets suitable for segmentation analysis:

The response provides a summary stating that the CUSTOMER_ANALYTICS table is the most suitable data set due to its certification, diverse attributes, and high data quality score. You can continue to analyze the CUSTOMER_ANALYTICS data set. Click the asset name to open it in Data Governance and Catalog.

The discovery agent has helped you identify the best customer data set to perform customer segmentation.

Discover assets from Data Integration

You can use the discovery agent to search and discover projects, folders, mappings, and mapping tasks in Data Integration with CLAIRE GPT.

Prerequisites

Before you perform data discovery tasks in CLAIRE GPT for Data Integration, ensure that you perform the following tasks:

- Enable the Data Integration service for the runtime environment that your organization uses.
- Verify that mappings and mapping tasks are available in Data Integration.
- Upgrade Data Integration to the latest version.
- Enable IDMC metadata in Metadata Command Center.

For information about how to set up CLAIRE GPT for users in your organization, see *Administration*.

Sample conversation

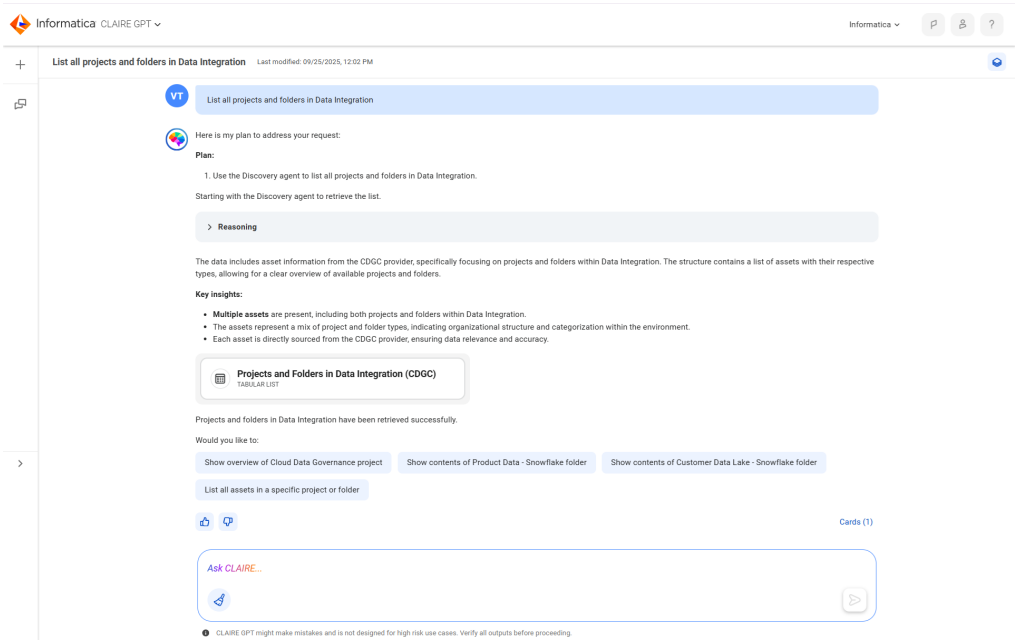

Let's take a look at a sample conversation to help you get started on your Data Integration data discovery journey in CLAIRE GPT. The sample conversation shows you how you can use CLAIRE GPT to search for projects, folders, mappings, and mapping tasks.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation by entering the following prompt:

   ```
   List all projects and folders in Data Integration
   ```

   The following image shows the response:

3. To view the projects and folder, select the card.

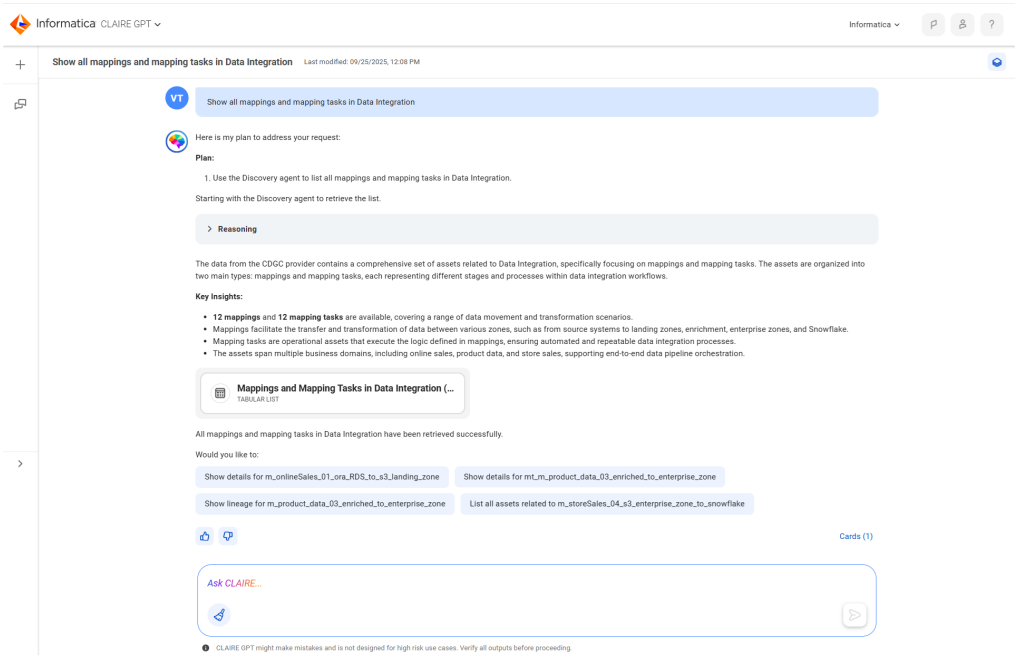

The following image shows the projects and folders:

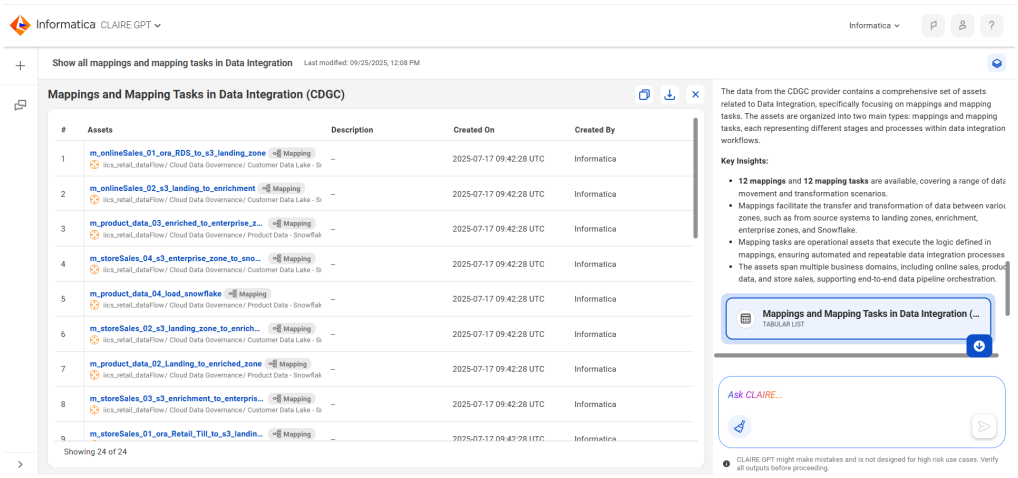

4. To get a list of mappings and mapping tasks, enter the following prompt:

   ```
   Show all mappings and mapping tasks in Data Integration
   ```

   The following image shows the response:

5. To view the mappings and mapping tasks, select the card.
   The following image shows the mappings and mapping tasks:

Discover assets from Data Marketplace

You can use the discovery agent to search and discover assets in Data Marketplace with CLAIRE GPT.

Prerequisites

Before you perform data discovery tasks in CLAIRE GPT for Data Marketplace, ensure that you upgrade Data Marketplace to the latest version.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Marketplace data discovery journey in CLAIRE GPT.

You're data steward in a cosmetics company. Your organization uses Data Marketplace to store sales data. You want to identify data collections in Data Marketplace that have no order history, and then collaborate with their stakeholders to decide whether to remove them or understand how you can improve their utilization if they are still valid.

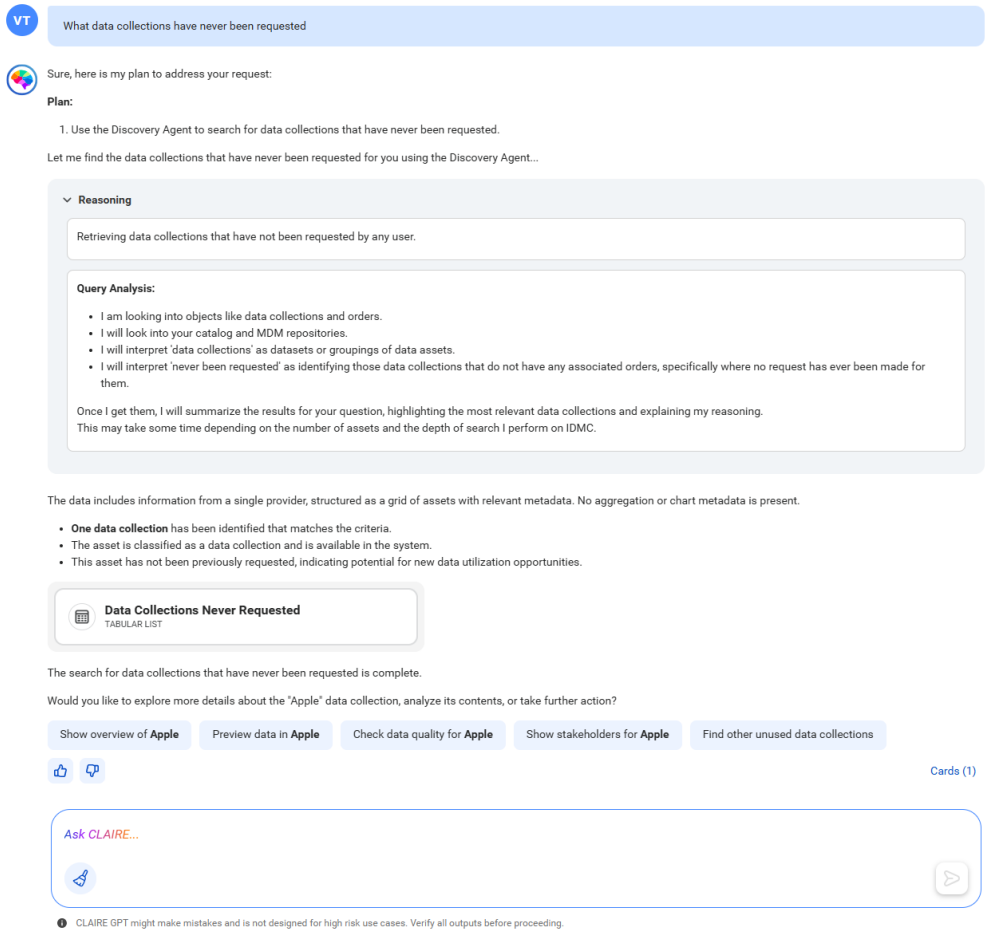

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to discover data collections that have no orders.

   Enter the following prompt:

   ```
   What data collections have never been requested
   ```

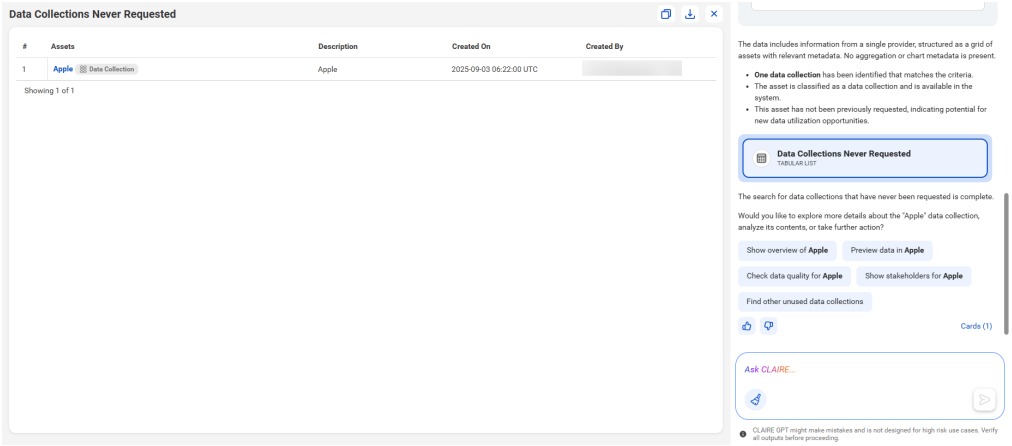

The following image shows the response of CLAIRE GPT, displaying data collections that have no orders:

Using the data discovery skill, the discovery agent has identified one data collection with no order history.

3. To preview the data collections, click the card named **Data Collections Never Requested**.

   The following image shows the canvas with a tabular view of the data collections with no orders:

   You can click the data collection name to view its details in Data Marketplace.

The discovery agent has helped you quickly identify the data collections that have no order history.

Discover assets from MDM SaaS

You can quickly search and discover business entities in MDM SaaS with CLAIRE GPT.

When you use data discovery to find assets in MDM SaaS, CLAIRE GPT returns the available business entities but doesn't return reference data sets.

CLAIRE GPT lists all business entities in MDM SaaS and a few prompt suggestions. You can click the suggested prompts to analyze deeper.

You can rapidly identify business entities and perform metadata and data exploration using simple natural language prompts.

Prerequisites

Before you perform data discovery tasks in CLAIRE GPT for MDM SaaS, ensure that you perform the following tasks:

- Enable the MDM SaaS service for the runtime environment that your organization uses.
- Verify that business entities are available in MDM SaaS.
- Upgrade Customer 360 SaaS, Product 360 SaaS, and Supplier 360 SaaS to the latest version.

Sample conversation

Let's take a look at a sample conversation to help you get started on your MDM SaaS data discovery journey in CLAIRE GPT.

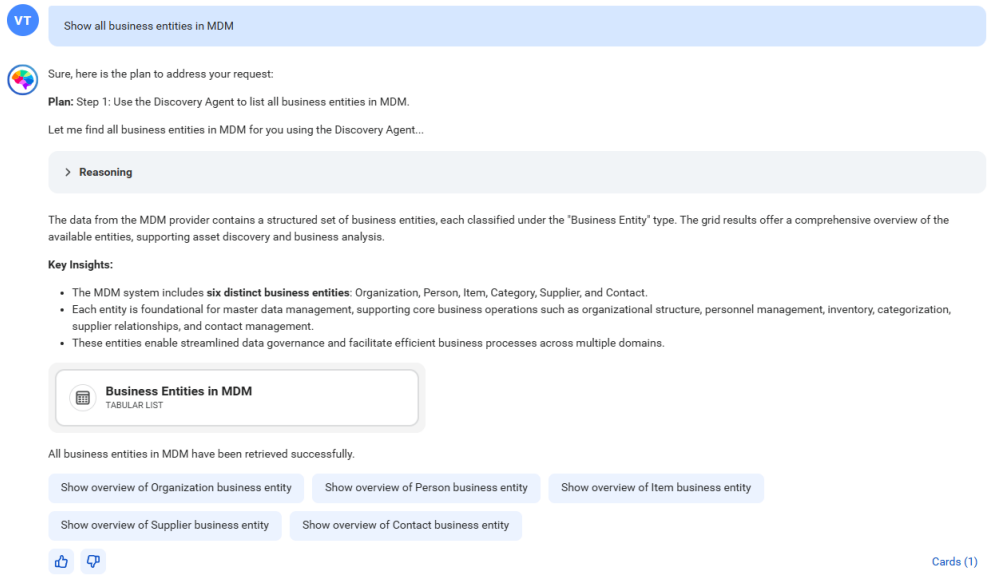

Your organization uses MDM SaaS to store customer, product, and supplier records. As a data steward, you want to discover all business entities in MDM SaaS and then discover business entities in Customer 360 SaaS to identify customer data that you can use in your analysis.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to help you discover all business entities in MDM SaaS.
   Enter the following prompt:

   ```
   Show all business entities in MDM
   ```

   The following image shows the response displaying all business entities in MDM SaaS:

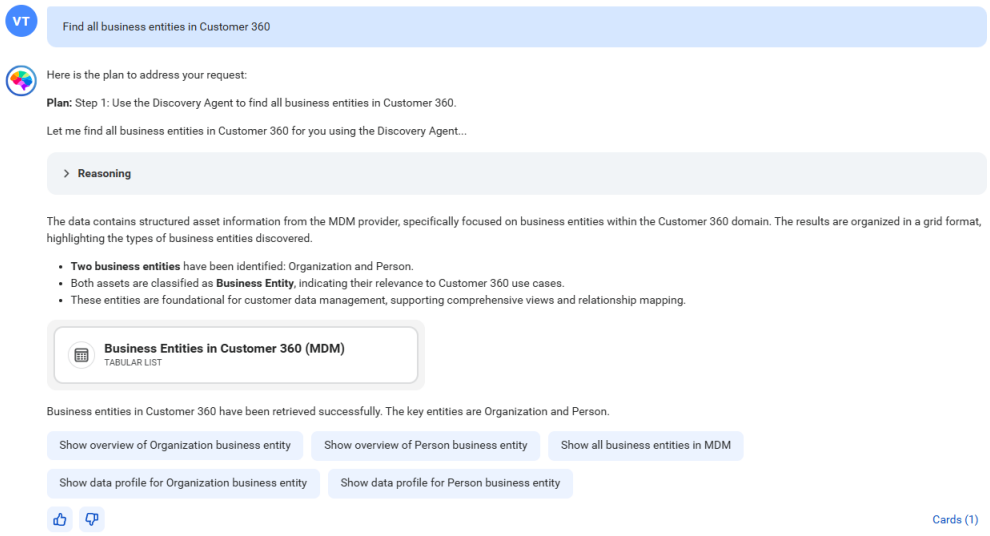

Using the data discovery skill of the discovery agent, CLAIRE GPT has found business entities that are available in MDM SaaS. You can expand the reasoning to view the query analysis process of the discovery agent.

To preview the business entities, click the card named **Business Entities in MDM**.

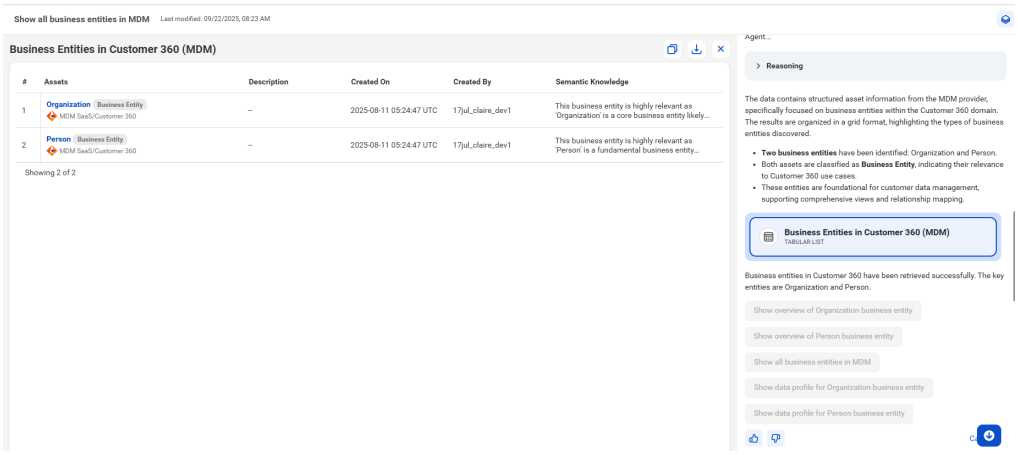

3. To find all business entities in Customer 360 SaaS, enter the following prompt:

```
Find all business entities in Customer 360
```

The following image shows the response displaying all business entities in Customer 360 SaaS:

4. To preview all business entities, you can click the card named **Business Entities in Customer 360 (MDM)**.
   The following image shows the canvas with a tabular view of business entities from Customer 360 SaaS:

   You can click the business entity name to see the details in MDM SaaS.

   Similarly, you can also discover business entities in Product 360 SaaS and Supplier 360 SaaS.

   Additionally, CLAIRE GPT displays prompt suggestions to explore relevant details.

CHAPTER 3

Metadata exploration

Search and explore the metadata of assets that you discover.

Use metadata exploration to explore, view, and understand the metadata of assets across Intelligent Data Management Cloud services. You can explore the metadata of assets from various data sources such as databases, data integration sources, data lakes, and data warehouses. You can then perform data-driven insights based on the responses from CLAIRE GPT.

CLAIRE GPT integrates with the following Intelligent Data Management Cloud services to help you explore the metadata of assets:

- Data Governance and Catalog
- Data Integration
- Data Marketplace
- MDM SaaS

Explore metadata of assets from the catalog

Explore, view, and understand the metadata of an asset in your catalog with CLAIRE GPT.

Note: When you search and explore the metadata of assets or perform data exploration, critical data elements appear first in the response, followed by other data elements sorted by precedence.

Prerequisites

Before you perform metadata exploration tasks in CLAIRE GPT for Data Governance and Catalog, ensure that you perform the following tasks:

- Enable the Data Governance and Catalog service for the runtime environment that your organization uses. For more information, see *Runtime Environments* in the Administrator help.
- Verify that you extracted metadata from the required source systems into the catalog. For more information, see *Asset Discovery* in the Data Governance and Catalog help.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Governance and Catalog metadata exploration journey in CLAIRE GPT.

You’re a data analyst and you want to create a report on customer engagement. Your organization catalogs its customer data in Data Governance and Catalog. You have discovered a table, CUSTOMER_ANALYTICS,

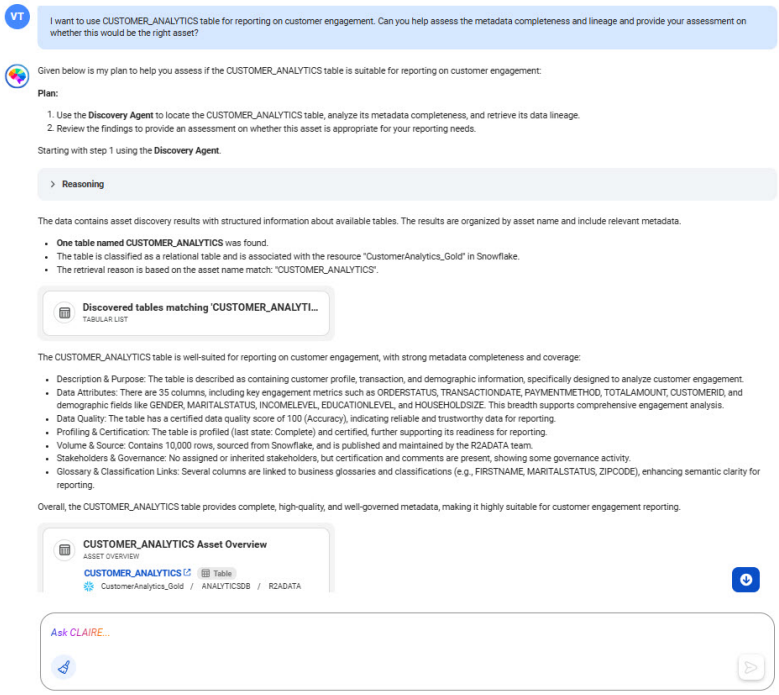

from the catalog. You want to assess the reliability and completeness of its data to decide if the table is suitable for creating a report on customer engagement.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to see the metadata completeness and data lineage of the CUSTOMER_ANALYTICS table.
   Enter the following prompt:

   ```
   I want to use the CUSTOMER_ANALYTICS table for reporting on customer engagement. Can you help assess the metadata completeness and lineage and provide your assessment on whether this would be the right asset?
   ```

   The following image shows the response displaying the discovered table and the metadata completeness information of the table based on its overview and data lineage:

   The metadata exploration skill of the discovery agent discovers the table and provides key insights on the overview of the table to assess whether this asset is appropriate for your reporting needs. The response includes a detailed explanation of the completeness of the table which is derived from its business name, description, data quality status, profiling status, associated classifications and glossaries, stakeholders and more.

   To evaluate if the table is reliable for your reporting needs, the agent provides the key insights from the table's lineage. Insights include the upstream and downstream assets in the data flow, and the sequence of transformations that the table has undergone.

The following image shows the response including key insights from the data lineage of the table, along with the lineage card:

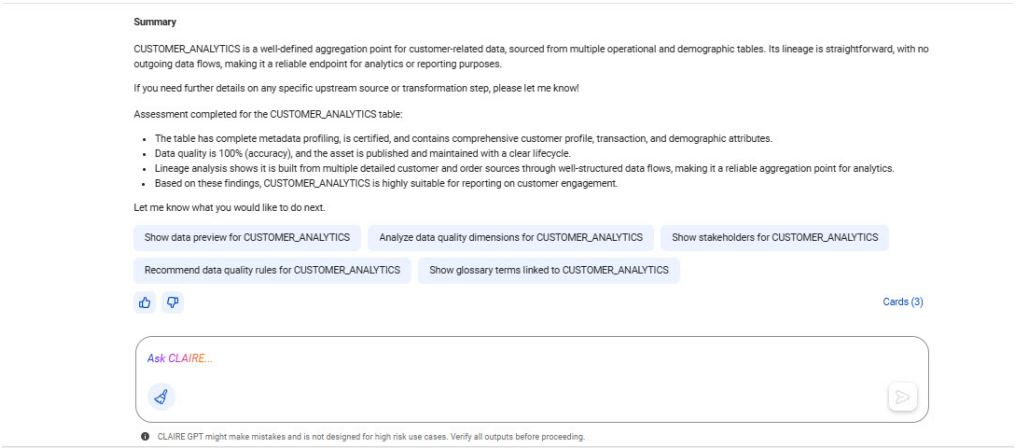

3. Click the lineage card to view the lineage. You can also click **Open in Data Catalog** to view the complete lineage in Data Governance and Catalog.
   The following image shows the visual lineage graph in the canvas, the option to open the lineage in Data Governance and Catalog, and a detailed explanation of the metadata completeness and lineage analysis:

   Based on the metadata completeness and clear lineage of the discovered table, the discovery agent summarizes that the table is a reliable candidate for reporting on customer engagement. You can continue to explore the metadata of the table or take other actions as suggested by CLAIRE GPT.

   The following image shows the summary and the suggested prompts for next actions in the response:

Explore metadata of assets from Data Integration

You can use the discovery agent to explore, view, and understand the metadata attributes of projects, folders, mappings, and mapping tasks in Data Integration with CLAIRE GPT.

Prerequisites

Before you perform metadata exploration tasks in CLAIRE GPT for Data Integration, ensure that you perform the following tasks:

- Enable the Data Integration service for the runtime environment that your organization uses.
- Verify that mappings and mapping tasks are available in Data Integration.
- Upgrade Data Integration to the latest version.
- Enable IDMC metadata in Metadata Command Center.
- Assign connections to reference source systems for mapping tasks in Metadata Command Center.

For information about how to set up CLAIRE GPT for users in your organization, see *Administration*.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Integration metadata exploration journey in CLAIRE GPT. The sample conversation shows how you can use CLAIRE GPT to explore, view, and understand the metadata attributes of projects, folders, mappings, and mapping tasks.

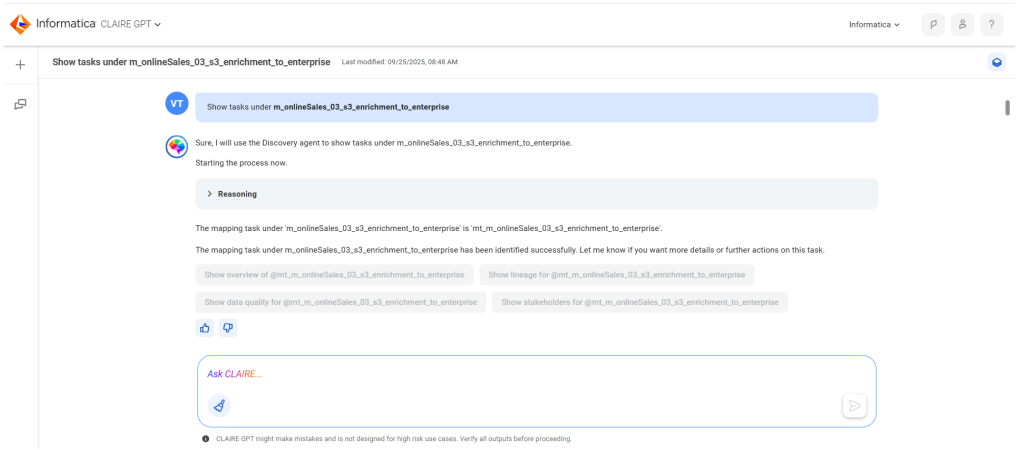

Note: Some prompts such as requests for lineage retrieve assets only from the Informatica Data Management Cloud resource, meaning that the asset is available in the catalog.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation by entering the following prompt:

   ```
   Show tasks under m_onlineSales_03_s3_enrichment_to_enterprise
   ```

   The following image shows the response:

3. To get an overview of the mapping task, enter the following prompt:

   ```
   Show overview of @mt_m_onlineSales_03_s3_enrichment_to_enterprise
   ```

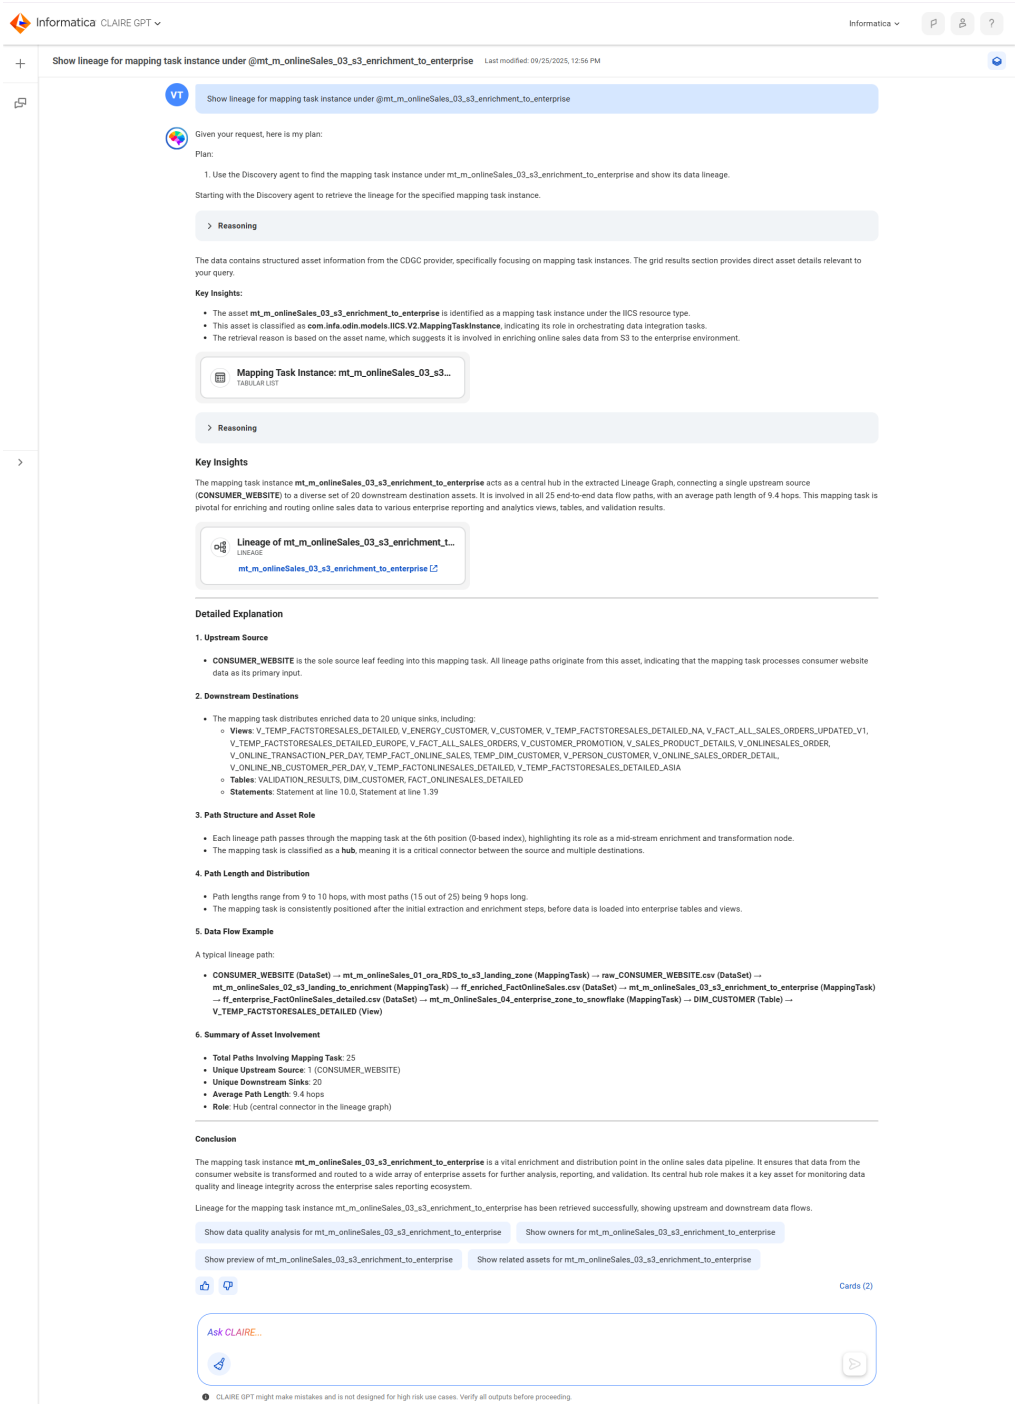

The following image shows the response:

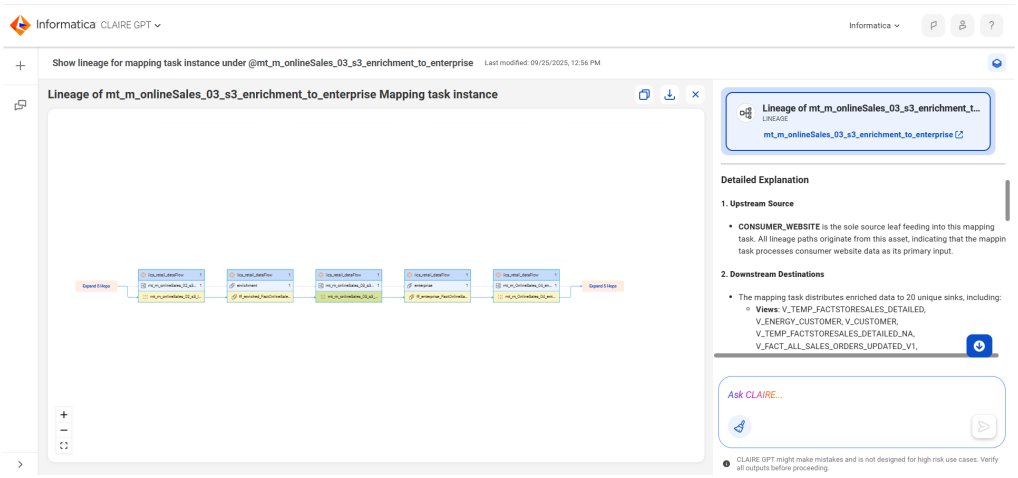

4. To get the lineage for the mapping task, enter the following prompt:

```
Show lineage for mapping task instance under
@mt_m_onlineSales_03_s3_enrichment_to_enterprise
```

The following image shows the response:

5. To view the lineage, select the card.
   The following image shows the lineage for the mapping task:

Explore metadata of assets from Data Marketplace

You can explore, view, and understand the metadata of a category or data collection in Data Marketplace with CLAIRE GPT.

Prerequisites

Before you perform metadata exploration tasks in CLAIRE GPT for Data Marketplace, ensure that you upgrade Data Marketplace to the latest version.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Marketplace metadata exploration journey in CLAIRE GPT.

You are the sales head for the Baltics region at a cosmetics company. You want to retrieve details of the Baltics sales data collection in Data Marketplace, verify if the data is up-to-date, and identify the stakeholders responsible for maintaining it.

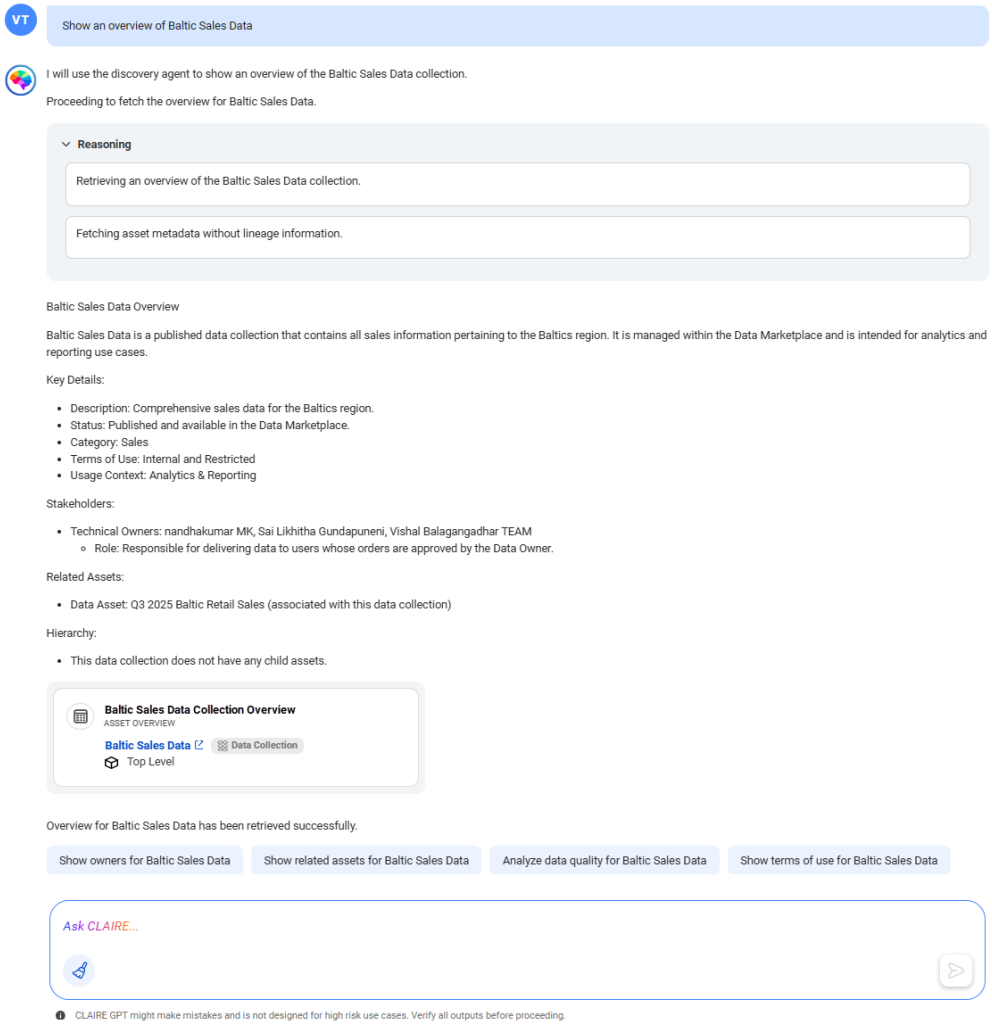

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to view the details of the 'Baltics Sales Data' data collection.

   Enter the following prompt:

   ```
   Show an overview of Baltic Sales Data
   ```

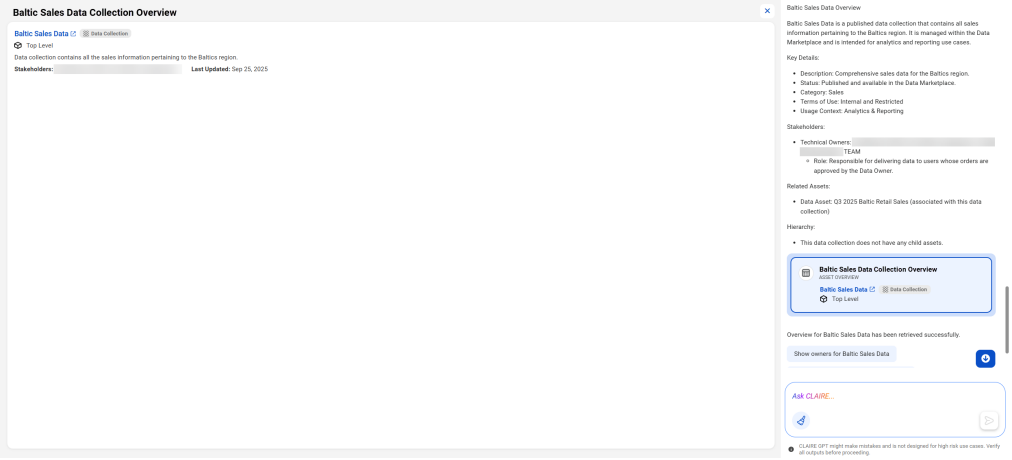

The following image shows the response of CLAIRE GPT, displaying an overview of the 'Baltics Sales Data' data collection:

Using the metadata exploration skill, the discovery agent has retrieved the details of the 'Baltics Sales Data' data collection.

3. To view the data collection details, click the card named **Baltic Sales Data Collection Overview**.

   The following image shows the canvas with the details of the 'Baltics Sales Data' data collection:

   You can click the data collection name to view its details in Data Marketplace.

The discovery agent has helped you quickly retrieve details of the 'Baltic Sales Data' data collection.

Explore metadata of assets from MDM SaaS

You can explore, view, and understand the metadata of an asset in MDM SaaS with CLAIRE GPT.

Prerequisites

Before you perform metadata exploration tasks in CLAIRE GPT for MDM SaaS, ensure that you perform the following tasks:

- Enable the MDM SaaS service for the runtime environment that your organization uses.
- Verify that business entities are available in MDM SaaS.
- Upgrade Customer 360 SaaS, Product 360 SaaS, and Supplier 360 SaaS to the latest version.

Sample conversation

Let's take a look at a sample conversation to help you get started on your MDM SaaS metadata exploration journey in CLAIRE GPT.

For example, as a data steward, you want to view an overview of a business entity and explore its attributes, data quality rule associations, survivorship rules, and match rules configured for the business entity. To explore the metadata assets, you can use the metadata exploration in CLAIRE GPT.

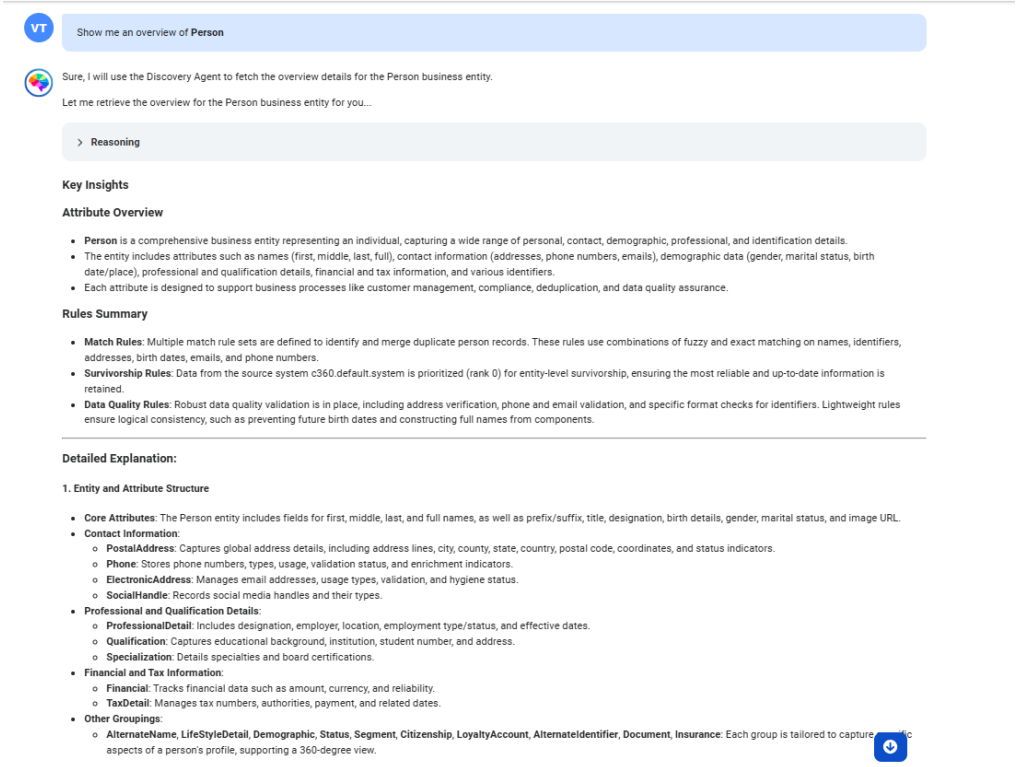

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to see the metadata assets of the Person business entity.

Enter the following prompt:

```
Show me an overview of Person
```

The following image shows the response displaying an overview of the Person business entity:

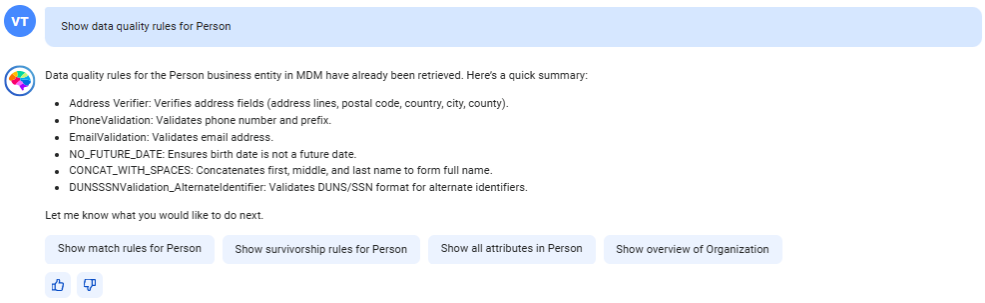

Using the discovery agent, CLAIRE GPT returns the description of the Person business entity, match rules, survivorship rules, and attributes.

Note: CLAIRE GPT displays only the attributes that are configured as searchable in the business entity.

3. To view all data quality rule associations configured in the Person business entity, you can enter the following prompt:

   ```
   Show data quality rules for Person
   ```

   The following image shows the response displaying all data quality rule associations that are configured in the Person business entity:

4. If you want to view all attributes that you are allowed to edit in the Person business entity, you can enter the following prompt:

   ```
   What attributes am I allowed to edit in Person?
   ```

The following image shows the response displaying all editable attributes in the Person business entity:

CHAPTER 4

Data exploration

Understand the quality and shape of the source data to identify data anomalies.

Explore the source data, preview a sample of the data set, see the SQL code used to fetch the data, and then save the data in a CSV file for future reference. Due to privacy guidelines, CLAIRE GPT doesn't save the sample data. If you refresh the browser or log out of CLAIRE GPT, the sample data will no longer be visible in the conversation, and you will be unable to download it.

CLAIRE GPT integrates with the following Intelligent Data Management Cloud services to help you explore the source data of assets:

- Data Governance and Catalog
- MDM SaaS

Explore source data of assets from the catalog

Explore source data and preview sample data sets in your catalog with CLAIRE GPT.

The following table lists source systems from which you can preview sample data:

Source System	Connection Type	Authentication Type
Amazon Redshift	Amazon Redshift v2	Default
Databricks	Databricks	Personal Access Token
Google BigQuery	Google BigQuery V2	Service Account
Microsoft Azure Synapse	Microsoft Azure Synapse SQL	Shared Key
Microsoft Azure SQL Server	SQL Server	SQL Server
Microsoft SQL Server	SQL Server	SQL Server Windows Authentication V2
Oracle	Oracle	Oracle Database
Snowflake	Snowflake Data Cloud	Standard

Source System	Connection Type	Authentication Type
Salesforce	Salesforce	Oauth
Salesforce	Salesforce Data 360	OAuth 2.0

You can explore Data Model Objects and Data Lake Objects asset types in the Salesforce Data 360 source system.

Consider the following guidelines before you perform data exploration:

- You can perform data exploration of tables that do not have primary and foreign key constraints defined at the schema level of the source system.
- When you perform data exploration, critical data elements appear first in the response, followed by other data elements sorted by precedence. You can view a maximum of 100 rows and 100 columns of sample source data.
- You need to run data profiling on assets in the catalog to get accurate results before you explore source data that contains specific information. For example, if a source system contains information on 'grass pollen' and you use the prompt 'find all patients allergic to grass,' the response might be inaccurate. To ensure that you get accurate results, run data profiling before you explore source data.
- When you perform data exploration, CLAIRE GPT might not find source data if the letter case of the search query differs from that of the source data. This occurs on the EM SouthEast 1 Azure and Canada Central 1 Azure PODs.
- When you perform data exploration on data from a Snowflake source system, sorting by the **Order By** SQL clause might not work as expected. This happens if you sort on the same SQL clause multiple times and the data has more than 100 rows.
- You can't view data preview of tables, databases, and schemas with names that contain special characters. You can view data preview of tables that include columns with names that contain special characters except the following characters:
  - :
  - \
  - ~
  - .

Prerequisites

Before you perform data exploration tasks in CLAIRE GPT for Data Governance and Catalog, ensure that you perform the following tasks:

- Enable the Data Governance and Catalog service for the runtime environment that your organization uses. For more information, see *Runtime Environments* in the Administrator help.
- Verify that you extracted metadata from the required source systems into the catalog. For more information, see *Asset Discovery* in the Data Governance and Catalog help.
- Configure the following connections on the **Connections** page of Administrator:
  - Amazon Redshift
  - Databricks

Note: Before you perform data exploration tasks in CLAIRE GPT, verify that the Databricks server is up and running to avoid delays in responses from CLAIRE GPT.

- Google BigQuery
- Microsoft Azure Synapse
- Microsoft Azure SQL Server
- Microsoft SQL Server
- Oracle
- Snowflake
- Salesforce
- Salesforce Data 360

For information about configuring a connection in Administrator, see *Connections* in Administrator.

- Enable the connections you configured earlier on the Secure Agent group from the **Enable/Disable Components in runtime environment** page of Administrator.
  For information about enabling connections for a Secure Agent group in Administrator, see *Runtime environments* in the Administrator help.
- Download the dynamic link libraries (DLLs). Required if you configure an SQL Server connection with Windows Authentication V2 authentication to access and preview sample data from Microsoft SQL Server source systems.
  Perform the following steps:
  1. Download the DLLs from the following location: MS SQL Server JBDC DLL
  2. Copy the DLLs to the Secure Agent installation directory. For example: `<Secure Agent installation directory>/ext/connectors/thirdparty/informatica.jdbc_v2/common`
- To get precise data exploration responses, enrich the data catalog and associate assets with accurate business terms and descriptions.
- For accurate and reliable data exploration responses, ensure that the primary and foreign key constraints of tables are properly defined at the schema level of the source system. For Google BigQuery and Microsoft Azure Synapse sources, create and run custom catalog sources in Metadata Command Center to extract and ingest the primary and foreign key constraints and their relationships into Data Governance and Catalog.
  For information about creating a custom catalog source in Metadata Command Center, see *Catalog Source Configuration* in Metadata Command Center.
- To get data exploration responses for tables that do not have primary key constraints defined at the schema level of the source system, you must enable data profiling and run the catalog source.

Configuring IDMC Data Gateway Service properties

Secure Agent services such as IDMC Data Gateway Service are pluggable microservices that the Secure Agent uses for data processing. To configure Secure Agent service properties, open the **Runtime Environments** page in Administrator and edit the Secure Agent. To change or optimize the behavior of the IDMC Data Gateway Service, you can configure the system and custom properties when you edit a Secure Agent.

To change or optimize the behavior of the IDMC Data Gateway Service, you can configure the system and custom properties when you edit a Secure Agent.

You can configure the following system properties of the IDMC Data Gateway Service in the **System Configuration Details** section:

Type	Name	Description	Value Range	Default Value
APP_CFG	idmc_dgs_connectionPoolMaxSize	The maximum number of data source connections cached for a Secure Agent.	Minimum is 10. Maximum is 1000.	100
APP_CFG	idmc_dgs_connectionPoolCacheExpiryDuration	The maximum duration for which the connection with a data source is kept open when it is unused. **Note:** The value of the parameter must be in minutes.	Minimum is 10. Maximum is 120.	30 minutes
APP_CFG	idmc_dgs_queryExecutionTimeout	The maximum duration for which a database query is run on a data source. **Note:** The value of the parameter must be in seconds.	Minimum is 1 There is no maximum value.	60 seconds

Note: APP_CFG refers to application configuration properties.

Sample conversation

Let's take a look at a sample conversation to help you get started on your Data Governance and Catalog data exploration journey in CLAIRE GPT.

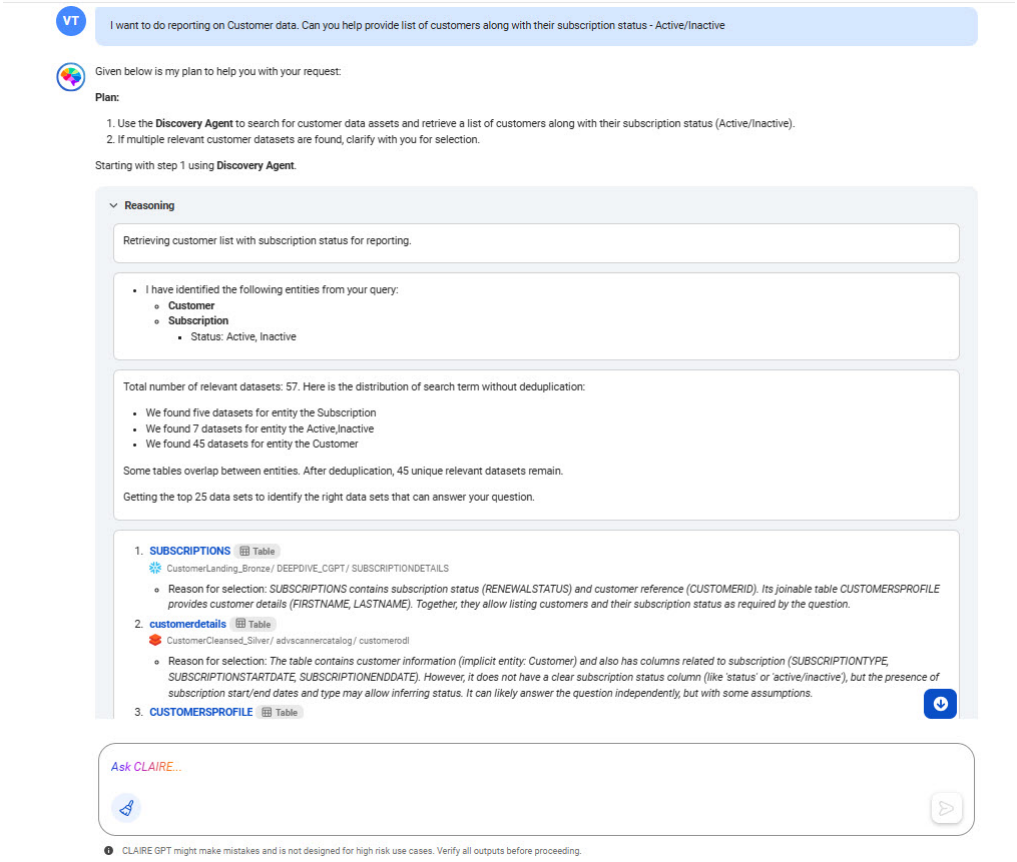

You're a marketing analyst. You want to create a report on customer data for an e-commerce company in order to design effective marketing campaigns for customers. Your organization catalogs the customer data in Data Governance and Catalog. To create the report, you need a list of customer profiles along with their subscription status and demographic details.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to get a list of customers along with their subscription status.
   Enter the following prompt:

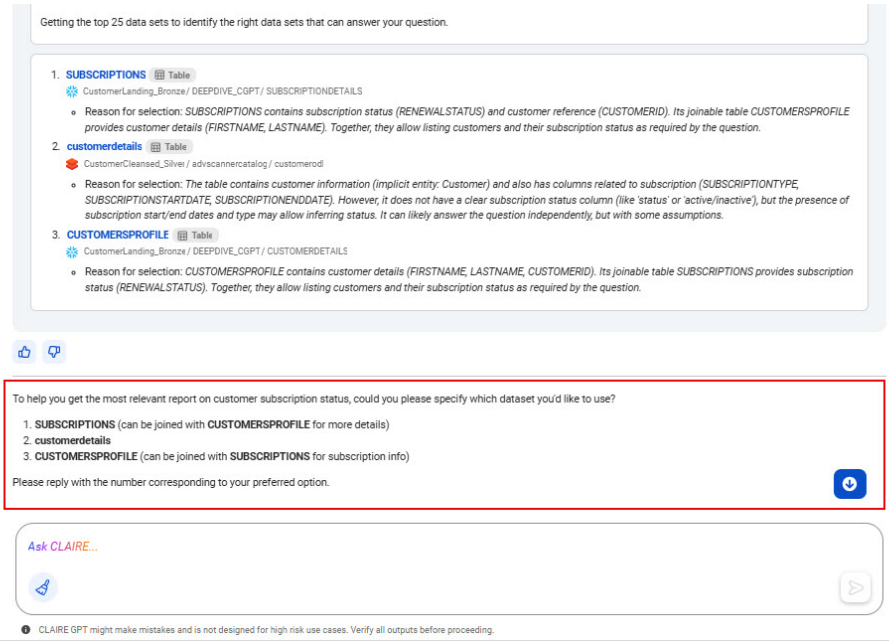

```
I want to do reporting on customer data. Can you provide a list of customers along
with their subscription status - Active/Inactive?
```

The following image shows the response displaying the relevant data sets across catalog sources that have customer details and their subscription status:

The discovery agent identifies and discovers the relevant data sets that contain customer information or the customer subscription status. The agent clearly states the reason for the selection of each data set. It incorporates human-in-the-loop interaction and asks you to select the data set that is best suited for your report.

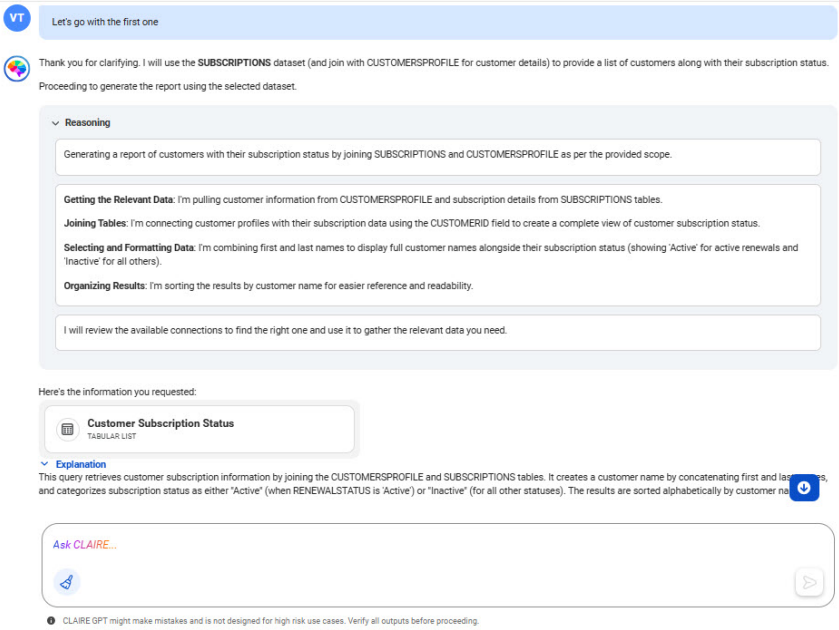

The following image highlights the question, demonstrating the human-in-the loop interaction to help you select the right data set:

3. Specify which data set you want to use.
Enter the following prompt:

```
Let's go with the first one
```

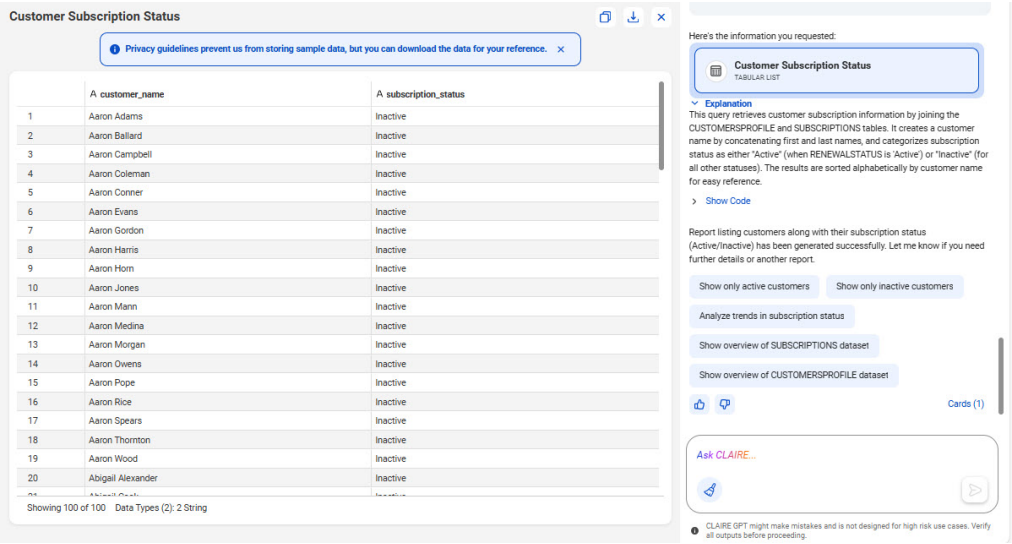

The following image shows the response to the prompt about using the SUBSCRIPTIONS data set which is the first among the discovered data sets:

The data exploration skill of the discovery agent pulls data from two relevant data sets, CUSTOMERSPROFILE and SUBSCRIPTIONS. To create a sample table for the customer subscription status, the data integration agent joins the two data sets. Further, it creates full customer names by

concatenating the first and last names, and categorizes subscription status as either `Active` or `Inactive`.

4. Click the card to view or download the sample table.
   The following image displays the `Customer Subscription Status` sample table.

You can download the sample table as a CSV file or copy the table to another file.

Explore records from MDM SaaS

You can explore records with specific search criteria and download the sample data with CLAIRE GPT.

After you search for records in CLAIRE GPT, navigate to a specific MDM SaaS business application to view additional search results.

Additionally, you can also explore field groups and nested field groups with multiple entries. CLAIRE GPT displays the entry that matches the prompt along with additional field group entries. For example, when you ask CLAIRE GPT to display the shipping address of a person, it displays the shipping address of the person along with additional addresses. You can also search for records based on a specific date or date range. You can also explore relationships and hierarchies in MDM SaaS. For example, when you ask CLAIRE GPT to display the relationship between two records, it displays how the records are related to each another with a relationship graph. You can view only direct relationships.

You can start a conversation in CLAIRE GPT, seamlessly switch to an MDM SaaS business application, and continue it in CLAIRE Copilot. In CLAIRE Copilot, you can use the same MDM SaaS prompts that you use in CLAIRE GPT.

Prerequisites

Before you perform data exploration tasks in CLAIRE GPT for MDM SaaS, ensure that you perform the following tasks:

- Enable the MDM SaaS service for the runtime environment that your organization uses.
- Verify that business entities are available in MDM SaaS.

- Upgrade Customer 360 SaaS, Product 360 SaaS, and Supplier 360 SaaS to the latest version.
- Ensure that the prompts include values from fields that are set as searchable and facetable in Business 360 Console.
  If the prompt contains data from fields that aren't searchable and facetable in Business 360 Console, CLAIRE GPT can't visualize or search for data.

  For more information about searchable and facetable properties, see *Define the Data Model* in the Business 360 Console help.
- Verify that your user role has the read privilege for business entities and attributes that you use in the prompts.
- To retrieve accurate prompt responses in CLAIRE GPT, ensure that the business entity attributes contain meaningful descriptions in Business 360 Console.
  For example, a business entity includes two City attributes, one for address and one for the place of birth. If your prompt is to find customers living in New York, CLAIRE GPT refers to the attribute description for the context.
- You can't use prompts to compare field values within business entities.
  For example, CLAIRE GPT doesn't return results for prompts, such as show me the list of records with the same marital status from Person and list all records with the same designation in Organization.
- To explore relationships and hierarchies, ensure that you specify the name of the business entity in the prompt.
- When you explore records with multiple field group entries, CLAIRE GPT returns the records with the specific field group entry that you search for along with the other field group entries.
  For example, if you enter a prompt to Find all @Person records and retrieve their home address, CLAIRE GPT returns the records with home address along with other address field group entries, such as billing address, shipping address, and office address.

Sample conversation

Let's take a look at a sample conversation to help you get started on your data exploration journey in CLAIRE GPT.

You're a data steward and you want to analyze all item records and top selling brands for an upcoming marketing campaign. To better understand the sales distribution, you want to create a pie chart that visualizes the item records by total sales quantity. Additionally, you want to generate a line chart that compares brands based on their average product ratings. You also want to search for records added from March 2023 to December 2025 and view product highlights of item records with the Logitech brand.

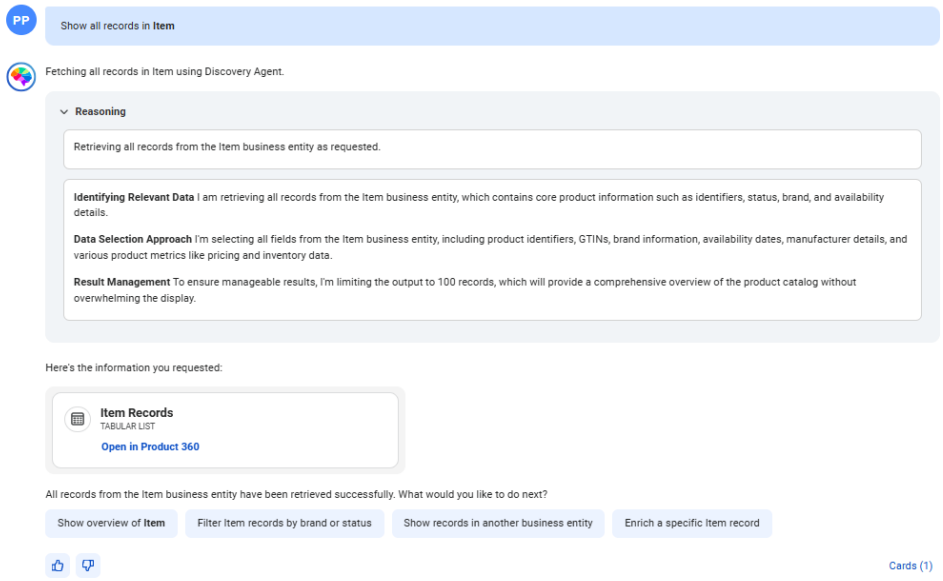

You also want to explore direct relationships and hierarchies. For example, you can explore the direct relationship between item and supplier records.

To achieve the goal, perform the following steps:

1. Log in to CLAIRE GPT.
2. Start a conversation to see all records in the Item business entity.
   Enter the following prompt:

   ```
   Show all records in @Item
   ```

The following image shows the response displaying a card containing all records in the Item business entity:

Using the data discovery agent, CLAIRE GPT also recommends prompt suggestions. You can select from the suggested prompts for further analysis.

3. To view all records in a tabular view, click the card named **Item Records**.
   The following image shows the response displaying a tabular view of all records in the Item business entity:

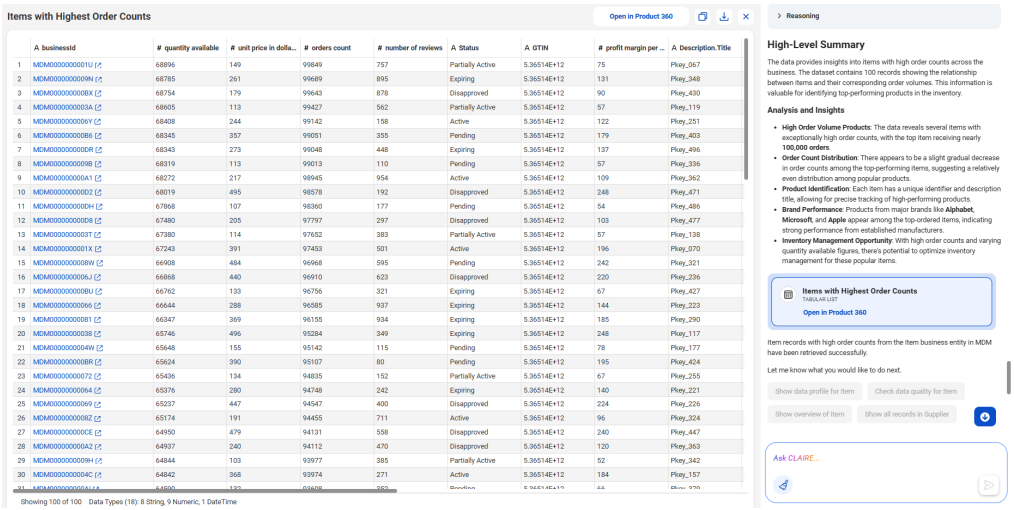

You can click a business ID to view the record in Product 360 SaaS. You can also click **Open in Product 360** to view all records in Product 360 SaaS.

Additionally, to copy and paste the sample data to a CSV file, click the **Copy** icon. To export the sample data to a CSV file, click **Download**. You can also navigate to the MDM SaaS business applications, such as Product 360 SaaS to view additional results.

4. To view the item records with high order counts, you can enter the following prompt:

```
Display Item records with high order counts.
```

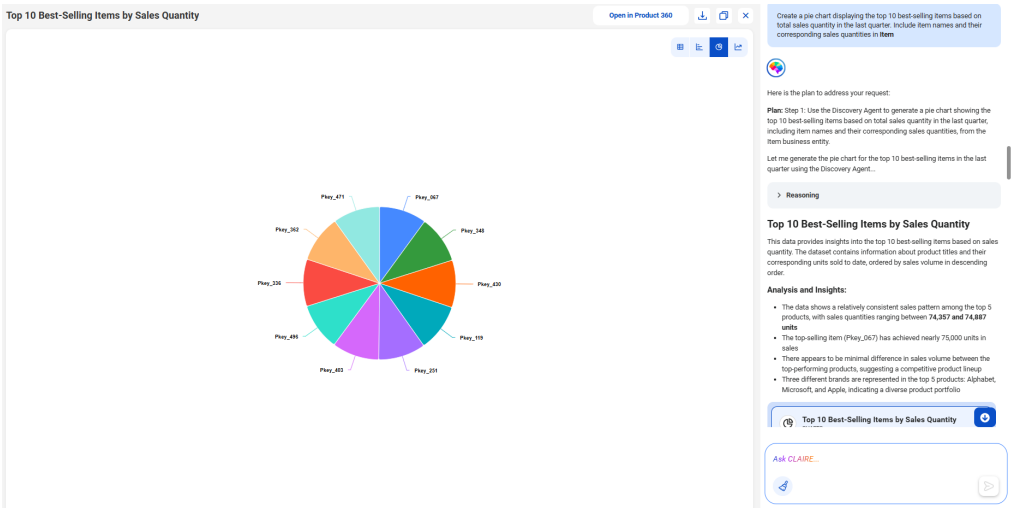

The following image shows the response displaying a tabular view of all records with high order counts in the Item business entity:

5. To visualize the top 10 item records based on the total sales quantity, enter the following prompt:

   ```
   Create a pie chart displaying the top 10 best-selling Item records based on total sales quantity in the last quarter. Include item names and their corresponding sales quantities.
   ```

   The following image shows the response displaying a pie chart that represents the top 10 best-selling item records:

6. To generate a line chart that compares items based on their brands and average ratings, enter the following prompt:

   ```
   Create a line chart to visualize the Item records based on their brand and rating.
   ```

   The following image shows the response displaying a line chart that represents the item records based on their brand and rating:

7. To search for item records that were added between a specific date range, enter the following prompt:

   ```
   Search for records in @Item business entity added between March 2023 to December 2025.
   ```

   The following image shows the response displaying all records in the Item business entity that were added between March 2023 to December 2025:

8. To view all product highlights of item records with the Logitech brand, enter the following prompt:

   ```
   Show product highlights of Item records with Logitech brand.
   ```

   The following image shows the response displaying product highlights of Item records with Logitech brand:

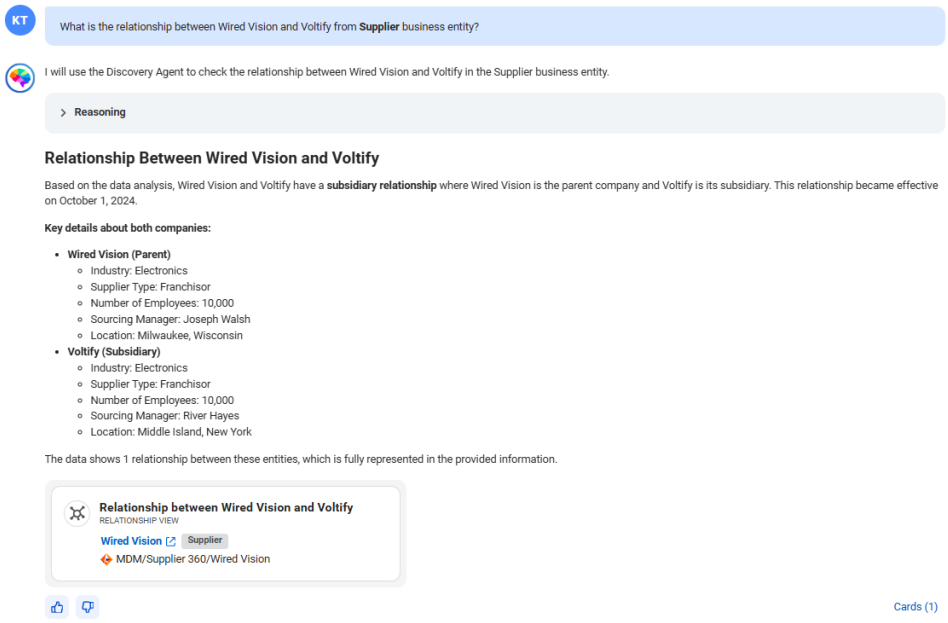

CLAIRE GPT displays the entry that matches the prompt and a link to view additional field group entries. When you click the link, the additional entries appear in a table.

If you want to continue your conversation in CLAIRE Copilot, click **Open in Product 360** and open CLAIRE Copilot in MDM SaaS. You can use the same MDM SaaS prompts that you use in CLAIRE GPT.

9. To view relationship between records from the Supplier business entity, enter the following prompt:

   ```
   What is the relationship between Wired Vision and Voltify from Supplier business entity?
   ```

   The following image shows the response displaying the relationship between Wired Vision and Voltify records:

   CLAIRE GPT displays fields that aren't set as searchable for the relationship assets in the reasoning.

   To view the relationship graph, click the card named **Relationship between Wired Vision and Voltify**.

   The following image shows the response displaying the relationship graph of Wired Vision and Voltify records:

You can view the relationship graph and the details of the relationship in a tabular format. To view the record in Supplier 360 SaaS, click the record name or click **Open in Supplier 360**.

In the preceding example, Wired Vision and Voltify have a subsidiary relationship. The Wired Vision record is the parent company and the Volify record is its subsidiary. To view the relationship details, click the connection.

The following image shows the response displaying relationship details between Wired Vision and Voltify records:
