Preface

Read *Foundations of AI Governance* to understand how to use Data Governance and Catalog to govern the usage of data sets related to Artificial Intelligence (AI) solutions within your organization.

CHAPTER 1

Introduction to AI Governance

AI governance refers to the set of policies, processes, and systems that help your organization deploy, use, and manage AI technologies responsibly and effectively.

AI governance provides oversight of AI technology and the data used to train the technology throughout its entire lifecycle. The oversight covers activities such as data governance, approval workflows, risk assessment, compliance checks, and auditing.

Uses of AI governance

The following benefits apply when you use robust AI governance:

- **Regulatory compliance**. Ensure that the AI systems you use comply with relevant laws and regulatory requirements.
- **Model validation**. Ensure that you validate AI models for each use case they support.
- **Model transparency**. Provide transparency of model evolution and data used to train and validate your model through lineage, including contextualization through relationships with other assets to show dependencies and usage patterns.
- **Data security**. Use access controls to carefully handle the data that your teams use to train and validate AI models and preserve data security. Data security also includes controlling who can view sensitive training data, implementing data masking techniques for personal information, and maintaining audit trails of data access.
- **Stakeholder accountability**. Establish clear ownership and responsibility for AI initiatives, AI systems, and AI models your organization uses by assigning stakeholders.

CHAPTER 2

Effective AI governance with Data Governance and Catalog

As your organization's usage of AI solutions grows, effective governance of AI systems becomes essential. Data Governance and Catalog offers features that help you govern AI solutions your organization uses.

Asset inventory

Data Governance and Catalog offers a comprehensive inventory of business and technical assets that represent different parts of AI use in your organization.

This comprehensive business asset inventory includes AI models, the systems that use those models, the geographies where you deploy AI, and the policies that guide AI usage. With a comprehensive inventory, you can identify all AI usage within your organization, understand the business processes that are dependent on AI, improve team coordination to avoid duplication, and ensure that all AI systems comply with regulatory requirements.

Currently, you can import AI model technical assets from the following catalog sources into Data Governance and Catalog:

- Databricks
- Microsoft Azure Machine Learning
- Google Vertex AI

If your organization uses an AI model from a different catalog source, you can represent it in Data Governance and Catalog with the AI Model business asset.

For more information about the assets that you can use for AI governance, see Chapter 3, "Asset types for AI governance" on page 9.

Collaboration

Data Governance and Catalog offers features that help stakeholders involved in AI governance across the organization to collaborate effectively, improve decision-making, and maintain human oversight of AI systems.

Stakeholders can create custom dashboards that provide AI teams with real-time insights into AI systems, models, projects, and the data used for AI initiatives across the organization.

Stakeholders can add comments to an asset involved in an AI initiative to provide their insights about the data. Other users in the organization can see the comments and provide their own inputs. Stakeholders can also rate an asset used in an AI initiative to indicate their assessment of the quality of the asset, certify an asset to endorse it for business decisions, and decertify an asset to indicate that it is no longer relevant.

Data lineage and audit trail

Effective AI use requires accurate, governed data that ensures transparency and traceability throughout the AI lifecycle. To maintain data accuracy, use Data Governance and Catalog to apply strong data governance in your organization.

Data lineage is a visual representation of the flow of data across the systems in your organization. Lineage shows how data flows from a system of origin to a system of destination. Lineage enables AI governance stewards to verify that the data used to train and validate the AI models comes from reliable sources.

Data Governance and Catalog offers a complete audit trail for AI models, the AI systems that use these models, the data used to train or validate them, and any other related assets involved in AI use within your organization.

Data observability

You can use the data observability capabilities offered by Data Governance and Catalog to verify the quality of data used by AI models.

Use data observability to continuously monitor the data used to train and validate the AI models that your organization uses. Comparing the AI model's output against standard statistical baselines helps detect anomalies and maintains the reliability of the model’s results. This ongoing oversight maintains the accuracy and reliability of input data. Accurate input data prevents flawed predictions, reduces biases, and avoids incorrect outputs.

Evaluation metrics

Use evaluation metrics to record additional data that pertains to an AI Model business asset. AI governance stewards can define evaluation metrics in Metadata Command Center. AI teams within your organization can use evaluation metrics to compare different models, identify potential biases, and monitor model behavior over time.

Data Governance and Catalog offers drift score and bias score as default metrics. However, if these evaluation metrics aren't relevant to your use case, you can replace them with your custom metrics.

When you import an AI model technical asset from a catalog source, Data Governance and Catalog displays the metrics scanned from the source. When you create an AI model business asset from the technical asset, you can map the scanned metrics to the evaluation metrics that you defined.

Workflows

A workflow specifies a series of predefined steps that a service follows when a user attempts to create or modify an asset, and includes the stakeholders who provide inputs for the change process. Each step is a task that a stakeholder of the asset performs. A workflow ensures that the right people have the opportunity to provide inputs, challenge, and approve matters related to the asset that is created or modified.

AI governance stewards can define workflows in Metadata Command Center to represent the governance processes pertaining to the AI systems and AI models used in your organization. A workflow includes the setup of tasks for the appropriate stakeholders.

Integration with Data Access Management

Use the Data Access Management page in Data Governance and Catalog to build policy-based data access controls and protections into data operations, which enable efficient, effective, and responsible data use.

Data stewards can use Data Access Management to establish data policies that mask, transform, or redact sensitive information before use, thereby ensuring compliance with your organization's privacy

policies. Data masking helps ensure that all data used to train and validate the models, especially personal and sensitive corporate information, is handled securely.

Integration with Data Marketplace

Data Marketplace is a transactional space that connects data providers with data consumers within an organization, thereby simplifying data discovery and data access processes. Data Governance and Catalog integrates with Data Marketplace.

AI teams within your organization can use Data Marketplace to discover data sets, AI models, and AI systems that are already published and approved for use. After teams identify assets relevant to their use case, they can access them through Data Marketplace.

Data stewards within your organization can use Data Marketplace to categorize and publish data that is curated for training AI models. AI Model owners can publish AI Model assets and other Data Governance and Catalog asset types that are essential to AI governance. Data scientists in your organization can discover the assets published in Data Governance and Catalog and place orders to gain access to them. Orders undergo a workflow approval process that involves relevant stakeholders who determine whether an order is valid. If a stakeholder approves the order, Data Access Management can provision access to the asset. Alternatively, an external process outside Data Marketplace can provision the access.

Integration with Data Quality

Data Quality helps you consistently check, cleanse, and prepare the data before you use it in AI applications. Assessing the data quality is essential to ensure that your data is ready to enable reliable AI outcomes.

Data stewards can use Data Quality to assess data for accuracy, completeness, consistency, timeliness, and uniqueness. They can also define custom parameters to evaluate data quality.

Data Quality empowers AI teams in your organization to define data quality rules and continuously monitor the data used for training and validating AI models. Continuous monitoring helps prevent poor-quality data from reaching AI systems, thereby reducing inaccuracies, erroneous outputs, and hallucinations.

CHAPTER 3

Asset types for AI governance

Data Governance and Catalog offers asset types that represent different aspects of AI usage within your organization. These assets cover AI models, the systems that use them, the geographies where you deploy AI, and the policies that govern AI usage.

The following table describes the Data Governance and Catalog assets that you can use for AI governance:

Asset Name	Description
AI Model	An AI Model asset represents an individual AI model. You can use AI Model assets to represent AI models, such as BERT and GPT, that AI systems use. You can use the asset to describe an AI model's purpose, data sources for training and validation, evaluation metrics, and the data sets that are involved. You can create an AI Model business asset or import AI Model technical assets from the catalog into Data Governance and Catalog. For more information about an AI Model asset, see "AI Model asset" on page 10.
AI System	An AI System asset represents a system that typically involves collaboration of one or more AI models working together to deliver AI capabilities. You can use AI System assets to represent one or more AI systems, such as chatbots and virtual personal assistants, that your organization uses. For more information about an AI System asset, see "AI System asset" on page 15.
Data Set	A Data Set asset represents identifiable groupings of data for a particular purpose. You can use a Data Set asset to represent the data used to train, fine-tune, or evaluate an AI model.
Project	A Project asset represents a collection of activities that are planned and organized to achieve a particular set of objectives. You can use a Project asset to document an AI initiative throughout its lifecycle. Use a Project asset to maintain oversight, capture stakeholder involvement, and document the problem the initiative solves. AI initiatives involve many complex steps. You can document the following aspects of an AI initiative in a Project asset: - Ideation of how AI will be used. - Identification of suitable models for the AI system. - Gathering of data for the models. - Building and testing of the AI system. - Launch, monitoring, and continuous improvement of the AI system.
Geography	A Geography asset captures areas, regions, or countries relevant to where your organization operates. You can use a Geography asset to represent territories where the AI initiatives will operate.

Asset Name	Description
Legal Entity	A Legal Entity asset captures corporate entities, whether these are part of your own group of companies or trusted partners and vendors. You can use a Legal Entity asset to create relationships with other business assets to provide context. You can link a Legal Entity asset to an AI Model asset to document the third-party provider that you sourced the model from. Documenting third-party providers also helps you track the different versions of an AI model that you sourced from each provider. Before you upgrade to a later version of an AI model, you can assess and compare the versions.
Policy	A Policy asset represents an internal collection of rules and guidance on how to conduct business and manage data. You can use a Policy asset to capture internal policies and guidance for developing and deploying AI initiatives.
Process	Use a Process asset to document important business activities so that the activity can be contextualized through relationships. You can use a Process asset to represent the processes you define around AI governance, such as importing and maintaining third-party models.
Regulation	Use a Regulation asset to document the important clauses of a major piece of legislation. You can relate a Regulation asset to a Policy asset, and use it to document the legislation that the AI initiative needs to comply with.

For more information about business assets, see the *Understanding Business Assets* help.

AI Model asset

An AI Model asset represents the essential parameters of an AI model. These parameters also include the model's lifecycle stage, the input parameters and the output schema, and the business purpose and rules for the model. AI models provide insights for many activities so that you can make faster and easier decisions or build predictive models.

AI Model technical asset

You can import AI Model technical assets from a catalog source into Data Governance and Catalog. Use this approach to gain a comprehensive view of all AI models within your catalog, including their latest evaluation metrics. You can then create AI Model business assets based on AI Model technical assets. This approach helps you maintain a complete inventory of AI models while focusing on creating business assets only for the models that are relevant to your organization's stakeholders.

For more information about the catalog sources from which you can import assets, see the *Understanding Technical Assets* help.

AI Model business asset

An AI Model business asset is an asset that you manually create to represent an AI model in Data Governance and Catalog.

When you open an AI Model asset in Data Governance and Catalog, the asset page lists the properties of the AI model that it represents. On the **Overview** tab of the AI Model asset page, you can view the system and

custom attributes of the AI model along with other basic information about the AI model. For example, if you have a machine learning classifier that analyzes a large set of web browser clickstream data to predict a user's navigation on your organization's website, you can create a business representation of this model in Data Governance and Catalog.

System attributes are the system-defined properties of an asset. Custom attributes are user-configured properties of the asset that you can use to specify and store specific information relevant to your assets beyond the system-defined attributes.

The following table describes the properties of an AI Model asset that you can view on the **Overview** tab:

Property	Description
Description	Functional definition of the AI model. The size of the field can't exceed 1 MB.
Attributes	System and custom attributes of the asset.
Reference ID	Unique reference identifier for the AI model.
AI Model Purpose	Purpose of the AI model.
Input	Data elements that represent the input parameters of the AI model.
Output	Data elements that represent the output after the AI model runs.
Environment	Indicates whether the AI model belongs to the training, validation, or production environment.
Model Rules	Rules that govern the use of the AI model.
Architecture Type	Architecture and algorithms used in the AI model.
Libraries	Software libraries used by the AI model.
Model format	Format in which the AI model is maintained.
Source Model Repository	Repository where the source of the AI model is maintained.
Contains	AI models that have a direct relationship with the source AI model.
Is Part Of	AI models that are part of the source AI model.
Data	Data sets that are associated with the AI model.

Property	Description
Evaluation Metrics	Additional data that pertains to an AI Model asset. You can use evaluation metrics to compare different models, identify potential biases, and monitor model behavior over time. An AI Model asset has the following predefined evaluation metrics: - **Drift Score**. Measure of degradation of the model. A higher value indicates greater degradation. Use the drift score to determine whether the model can provide results within an acceptable range of accuracy. The system measures drift score as a percentage. Enter a value between `0` and `100`. Ensure that the value you enter has a maximum precision of `5` digits and a scale of `2` decimal places. - **Bias Score**. Measure of a model's tendency toward systematic errors or unfair outcomes across different groups. A higher value indicates a greater difference between the predicted result and the actual result. Use the bias score to determine whether the assumptions in the model are correct. The system measures bias score as a percentage. Enter a value between `0` and `100`. Ensure that the value you enter has a maximum precision of `5` digits and a scale of `2` decimal places. In Metadata Command Center, your administrator can define additional metrics. For more information, see the *Administration* help in Metadata Command Center.
Associated AI Model Versions	The AI Model technical asset that you used to create the AI Model asset.
Stakeholders	Users responsible for the AI model or interested in the AI model.
Asset Groups	One or more asset groups assigned to this asset. Asset groups allow users access to a set of assets in the organization. You can assign asset groups to an asset if you are the stakeholder of the asset or if your organization administrator has granted you the **Manage Access** permission on the asset through access policies in Metadata Command Center. For more information about asset groups, see the *Metadata Access Control Handbook*.
Data Marketplace	Details of an asset's presence in Data Marketplace. If an asset is added to a data collection in Data Marketplace, you can view the details of the data collection. For more information about how you can connect Data Governance and Catalog to Data Marketplace, see the *Set Up Data Marketplace* help in Data Marketplace. For more information about how you can add an asset to a data collection, see the *Working With Data Collections* help in Data Marketplace.
Created By	User that created the AI model and the date when the asset was created.
Updated By	User that last updated the AI model and the date when the asset was updated.

For more information about the other tabs on an AI Model asset page, see the *Understanding Business Assets* help.

In Metadata Command Center, you can customize the layout and attributes of an AI Model asset. For more information about asset customization, see the *Administration* help in Metadata Command Center.

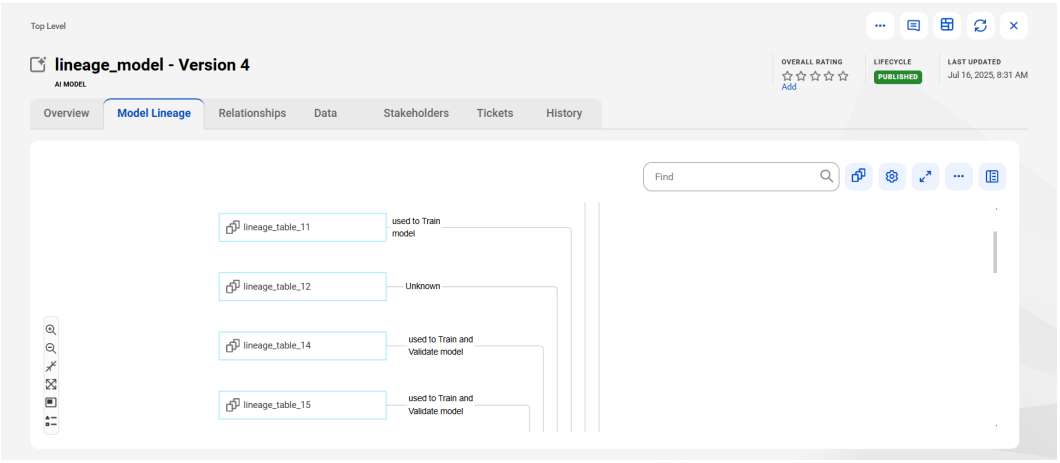

Model lineage

Data Governance and Catalog displays model lineage on AI Model assets, providing a visual representation of the data sets and other AI models associated with the AI model. You can view model lineage to identify the data used to train or validate an AI model, and understand its dependencies on other AI models.

On the **Model Lineage** tab of an AI Model asset page, you can view a visual representation of the data sets and other AI models associated with the AI model.

For an AI model that is imported from a catalog source, model lineage assigns the **Unknown** relationship type if Data Governance and Catalog can't identify the relationship between the AI model and its associated data sets. When you create an AI Model business asset from the AI Model technical asset, you can change the relationship type to a value such as **used to Train model**, **used to Validate model**, and **used to Train and Validate model**.

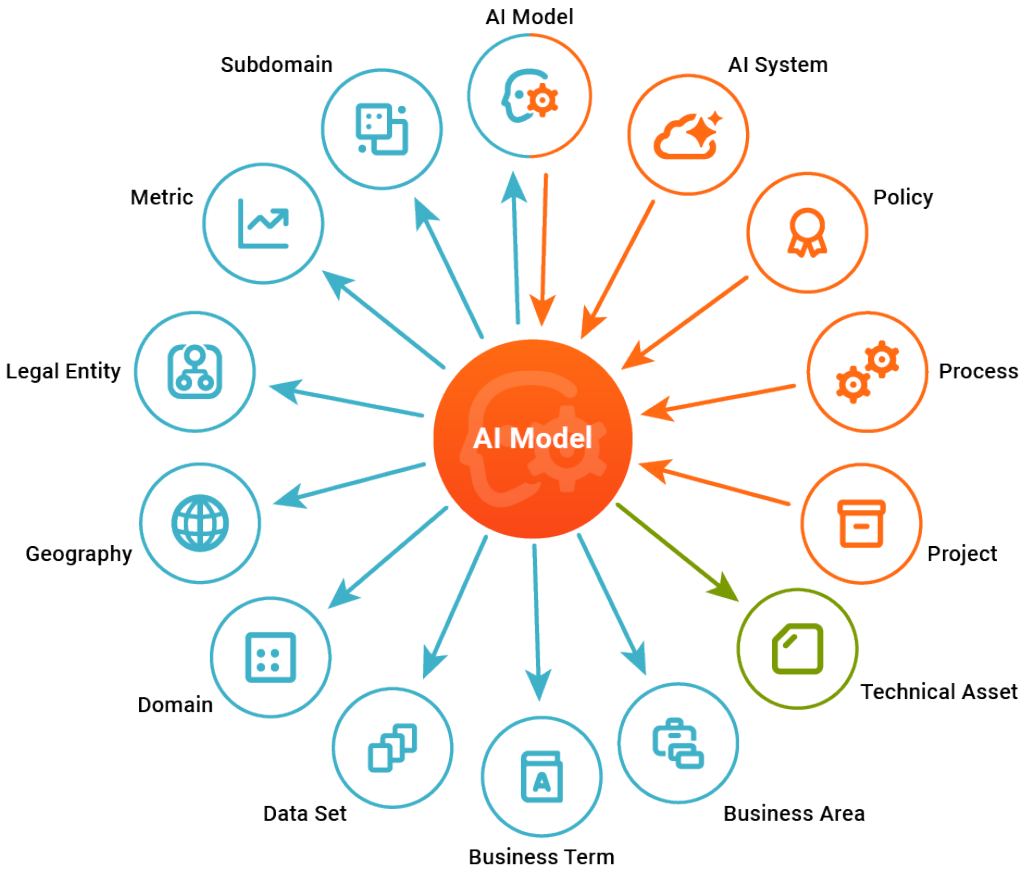

The following image shows the **Model Lineage** tab of a sample AI model asset:

Asset relationships

You can create various types of direct relationships between an AI Model asset and other assets. You can use these relationships to describe an AI model's association with the data sets used to train it, add business context by linking to assets such as Geography and Legal Entity, or improve the AI Model asset's searchability within Data Governance and Catalog.

The following image shows how an AI Model asset relates to other assets:

The following table describes the predefined relationships between AI Model assets and other assets:

Source Asset Type	Target Asset Type	Relationship Type	Meaning of Relationship Type
AI Model	AI Model	is the Base for	An AI Model asset is the base for another AI Model asset.
AI Model	AI Model	is Quantized into	An AI Model asset is quantized into another AI Model asset.
AI Model	AI Model	is Derived from	An AI Model asset is derived from another AI Model asset.
AI Model	AI Model	is a Quantization of	An AI Model asset is the quantization of another AI Model asset.
AI Model	Business Term	is Related to	An AI Model asset is related to a Business Term asset.

Source Asset Type	Target Asset Type	Relationship Type	Meaning of Relationship Type
AI Model	Data Process	is Used in	An AI Model asset's data is used in a Data Process asset.
AI Model	Technical Data Set	is Generating (Target)	An AI Model asset generates a Technical Data Set asset.
AI Model	Technical Data Set	is Using (Source)	An AI Model asset uses a Technical Data Set asset's data as source.
AI Model	Domain	is Related to	An AI Model asset is related to a Domain asset.
AI Model	Metric	is Related to	An AI Model asset is related to a Metric asset.
AI Model	Notebooks or Scripts	is Used in	An AI Model asset's data is used in a Notebooks or Scripts asset.
AI Model	Subdomain	is Related to	An AI Model asset is related to a Subdomain asset.

For more information about asset relationships, see the *Asset Discovery* help.

AI System asset

The AI System asset is a system that uses one or more AI models to perform a range of tasks, such as generating predictions, content, recommendations, decisions, and actions. You can use the AI System asset to record information about the technologies, AI models, and data that the system uses.

Asset overview

An AI System business asset is an asset that you manually create to represent an AI system in Data Governance and Catalog.

When you open an AI System asset in Data Governance and Catalog, the asset page lists the properties of the AI system that it represents. On the **Overview** tab of the AI System asset page, you can view basic information about the AI System asset.

System attributes are the system-defined properties of an asset. Custom attributes are user-configured properties of the asset that you can use to specify and store specific information relevant to your assets beyond the system-defined attributes.

The following table describes the properties of an AI System asset that you can view on the **Overview** tab:

Property	Description
Description	Description of the AI system. The size of the field can't exceed 1 MB.
Attributes	Displays the system and custom attributes of the asset.
Reference ID	Unique identifier for the AI system.
AI System Type	Type of AI system. An AI System asset can be one of the following types: - **AI Application**. A software program that uses artificial intelligence techniques to perform specific tasks. - **AI Agent**. An autonomous AI entity designed to take action within a particular environment to achieve specific goals. - **Retrieval System**. An AI system that searches and retrieves relevant data in response to queries. - **Conversational**. An AI system, such as a chatbot or virtual assistant, that interacts with users through natural language dialogue.
Development Stage	The phase in the AI system lifecycle that you can choose from a predefined list. During this stage, you might perform data preparation, model design, training, and validation to build and improve the AI system's performance. This property can have one of the following values: - **In Development**. The AI system is in development. - **Validation**. The AI system is being validated. - **Production**. The AI system is already in use.
AI Models	AI models associated with the AI system. A single AI model can be used by multiple AI systems. You can create relationships to link an AI Model asset to each AI System asset that depends on it. For each AI System asset that uses the AI Model asset, the AI Model section on the **Overview** page displays the model.
Asset Groups	One or more asset groups assigned to this asset. Asset groups allow users access to a set of assets in the organization. You can assign asset groups to an asset if you are the stakeholder of the asset or if your organization administrator has granted you the **Manage Access** permission on the asset through access policies in Metadata Command Center.
Stakeholders	Users responsible for the AI system or interested in the AI system.
Created By	User that created the AI system and the date when the asset was created.
Updated By	User that last updated the AI system and the date when the asset was updated.

For more information about the other tabs on an AI System asset page, see the *Understanding Business Assets* help.

In Metadata Command Center, you can customize the layout and attributes of an AI System asset. For more information about asset customization, see the *Administration* help in Metadata Command Center.

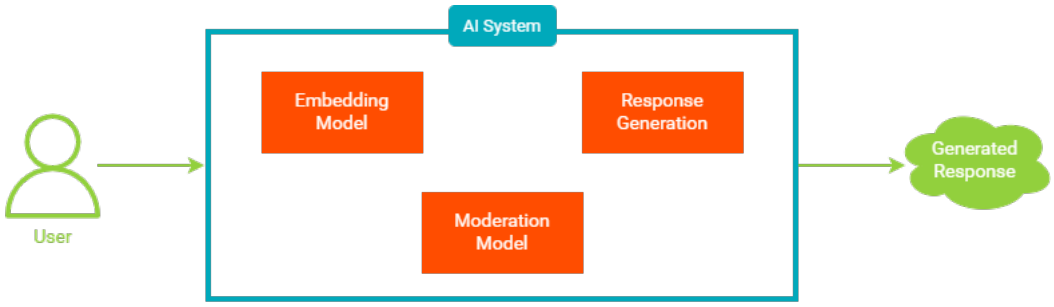

Example of an AI System asset

Your organization has deployed an AI-powered chatbot to help customers with their queries while they use its supply chain management software. The chatbot comprises the following models:

- **Moderation model**. Checks for harmful or inappropriate content in the user's query. If the input violates guidelines, the system can block or flag the query before further processing. The moderation model also reviews the response generated by the response generation model to ensure that it contains no content that violates guidelines.
- **Embedding model**. Helps retrieve documents that might be relevant to the user's query. The retrieval helps the response generation model produce a more accurate and informed reply.
- **Response generation model**. Creates a response based on its training that is relevant to the user's query.

In Data Governance and Catalog, you can create an AI System asset to represent the AI chatbot that your organization uses and create AI Model assets to represent the AI models used by the chatbot.

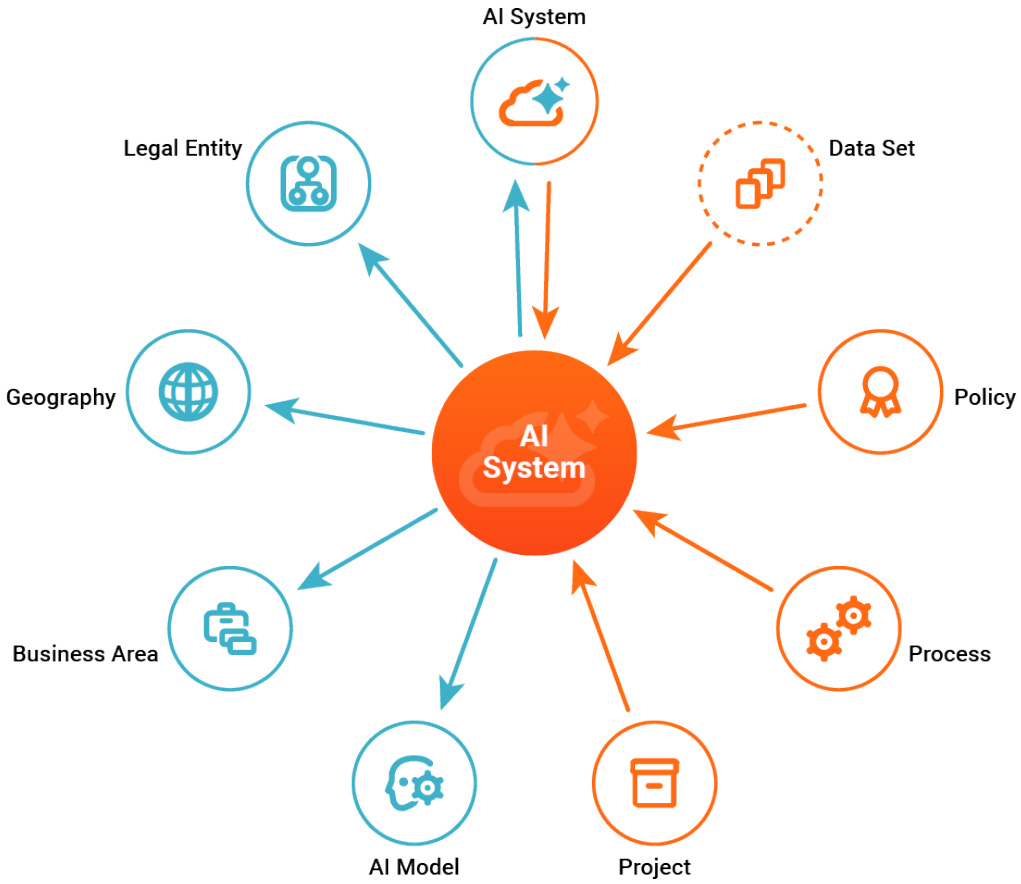

The following image shows an example of a sample AI chatbot that is an AI System asset:

Asset relationships

You can create various types of direct relationships between an AI System asset and other assets. You can use these relationships to describe an AI system's association with the models used by it, its relationship with other AI systems, add business context by linking to assets such as Geography and Legal Entity, or improve the AI System asset's searchability within Data Governance and Catalog.

The following image shows how an AI System asset relates to other assets:

The following table describes the predefined relationships between AI System assets and other assets:

Source Asset Type	Target Asset Type	Relationship Type	Meaning of Relationship Type
AI System	AI Model	is Related to	An AI System asset is related to an AI Model asset.
AI System	AI System	is Related to	An AI System asset is related to another AI System asset.
AI System	Business Area	is Related to	An AI System asset is related to a Business Area asset.
AI System	Geography	is Related to	An AI System asset is related to a Geography asset.
AI System	Legal Entity	is Related to	An AI System asset is related to a Legal Entity asset.

For more information about asset relationships, see the *Asset Discovery* help.

CHAPTER 4

Example: Leverage externally sourced AI models

GamesRUS is a digital distribution service and storefront for video games. GamesRUS uses Data Governance and Catalog to manage its assets.

Problem statement

GamesRUS uses an AI-powered interactive shopping assistant to help customers. The assistant clarifies questions and narrows down options based on customer preferences.

The shopping assistant comprises a moderation model, an embedding model, and a Large Language Model (LLM). The Data Science team within GamesRUS develops the moderation model and embedding model, while GamesRUS sources the LLM from outside the organization.

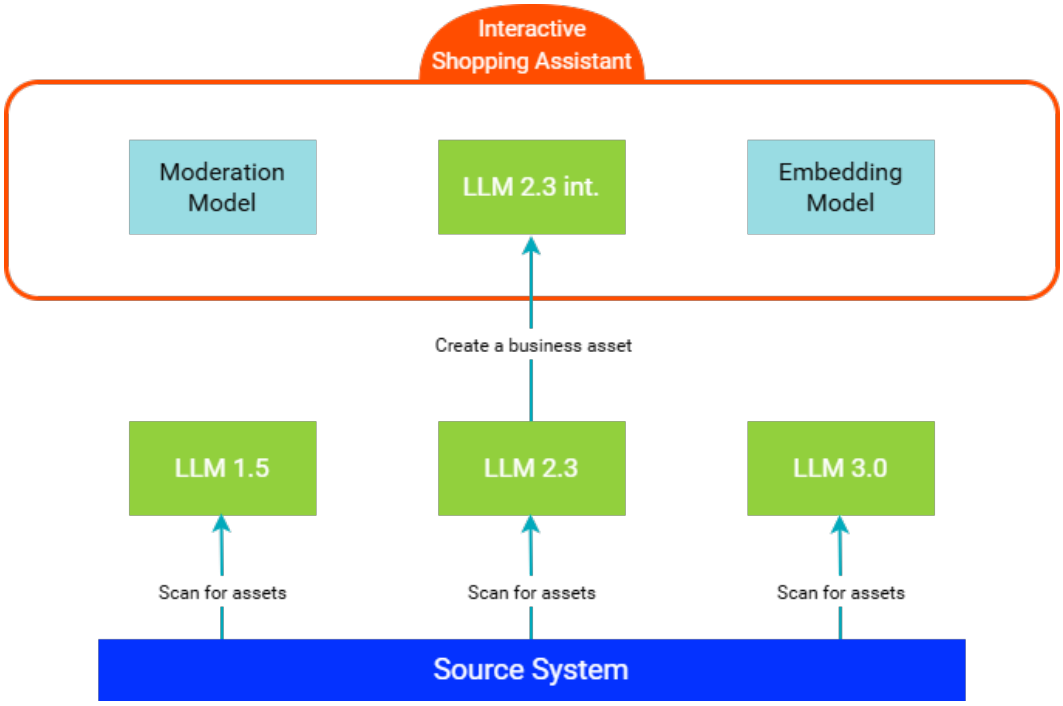

GamesRUS has concerns about externally sourced AI models because changes in newer versions that are not backward compatible could negatively impact the shopping assistant. Additionally, new model versions might not offer significant improvements to justify upgrading the assistant's underlying model.

Solution

The GamesRUS Data Science team uses Data Governance and Catalog to document LLMs sourced from outside the organization. They assess the impact of upgrading to newer LLM versions and also collaborate with key stakeholders to determine whether a new version is suitable for deployment.

Solution summary

The following image shows an overview of how you can use Data Governance and Catalog for AI governance:

As a member of the Data Science team, you can achieve the goal by performing the following steps:

Create AI Model assets

In Data Governance and Catalog, create the following assets:

- 'Moderation Model' AI Model asset. The moderation model checks for harmful or inappropriate content in the user's query. If the input violates guidelines, the system can block or flag it before further processing. The moderation model also reviews the responses generated by the Large Language Model (LLM) to ensure that they contain no content that violates guidelines.
- 'Embedding Model' AI Model asset. The embedding model scans the GamesRUS product catalog to create meaningful representations of the video games on the platform. The embedding helps the shopping assistant deliver accurate and personalized product recommendations to the user.

For more information about creating AI Model assets, see "Creating AI Model assets" on page 21.

Create an AI System asset

In Data Governance and Catalog, create the 'Interactive Shopping Assistant' AI System asset. The shopping assistant that GamesRUS uses helps users by understanding their queries, providing product recommendations, answering questions, and guiding them through the shopping experience.

For more information about creating AI System assets, see "Creating an AI System asset" on page 24.

Define metrics to evaluate the AI models

To accurately assess the LLMs from an external source system, you identified the following metrics: error rate, intent recognition accuracy, query adaptability, and response latency.

In Metadata Command Center, create the evaluation metrics. For more information about creating evaluation metrics, see "Defining evaluation metrics" on page 26.

Use AI Model technical assets to create AI Model business assets

In Data Governance and Catalog, use an AI Model technical asset to create an AI Model business asset. You can use this approach to add business context to an AI Model technical asset. The added business context helps stakeholders assess whether it is suitable to replace the shopping assistant's underlying LLM.

For more information about creating AI Model business assets from technical assets, see "Creating AI models from technical assets" on page 28.

Creating AI Model assets

In Data Governance and Catalog, create business AI Model assets for the embedding model and the moderation model. The moderation model checks the user's query for harmful or inappropriate content and reviews the LLM-generated response to ensure that neither violates the guidelines. The embedding model scans the GamesRUS product catalog to create meaningful representations of the video games on the platform.

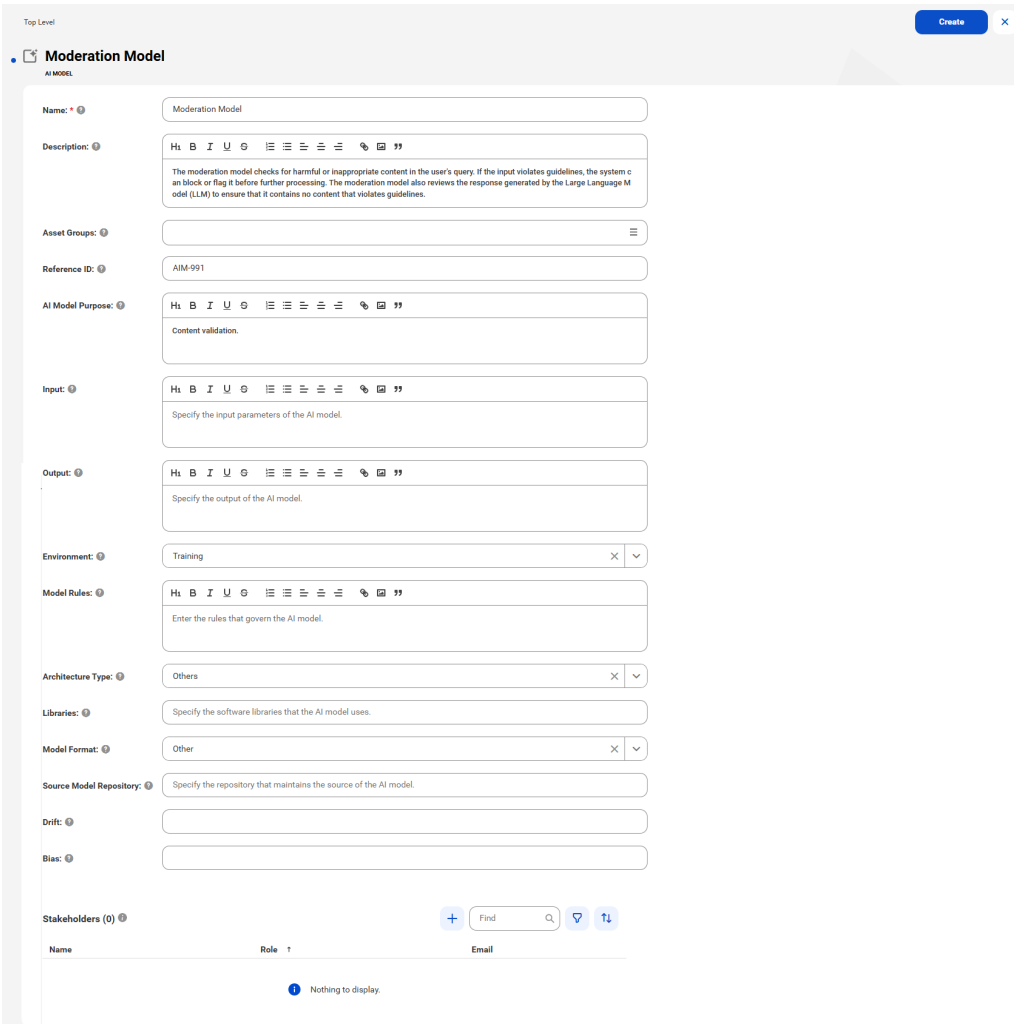

The following prerequisites apply if you want to create assets:

- The organization administrator grants you the **Create** permission for the AI Model asset type through access policies in Metadata Command Center.
- To assign stakeholders to the asset, the organization administrator grants you the **Manage Access** permission on the asset through access policies in Metadata Command Center.

For more information about the available privileges and permissions that the organization administrator can enable, see the *Asset Management* help.

1. In Data Governance and Catalog, go to the **Home** page, and click **New**.

2. In the **New** dialog box, select **AI Model**.

3. On the new asset page, enter the required properties of the asset.

   The following table describes the properties that you can configure for the AI Model asset:

Property	Description
Name	Required. Enter the name of the AI Model asset. To create the AI Model asset for the moderation model, enter `Moderation Model`. To create the AI Model asset for the embedding model, enter `Embedding Model`.
Description	Optional. Enter the description of the asset. You can also add images that are less than 1 MB.
Asset Groups	Optional. One or more groups of assets that you can assign to this asset. You can use asset groups in access policies to control access to assets.

Property	Description
Reference ID	Optional. Unique identifier that you can provide for the asset. If you don't provide the reference ID, the system automatically generates a reference ID for the business asset. For more information about reference ID for business assets, see the *Asset Management* help.
AI Model Purpose	Optional. Describe the business or technical purpose of the asset.
Input	Optional. Enter the input parameters for the AI model.
Output	Optional. Enter the output schema.
Environment	Select the environment for the asset. You can select one of the following options: - Training - Validation - Production
Model Rules	Optional. Define the rules that govern the use of the AI model.
Architecture Type	Optional. Select the architecture type of the AI model. You can select one of the following options: - **Linear Regression**. The architecture type that computes the linear relationship between the dependent variable and other independent variables. - **Logistic Regression**. The architecture model that accomplishes binary classification tasks by predicting the probability of an outcome, event, or observation. - **Linear Discriminant Analysis**. The architecture model that you can use as a classifier and a dimensionality reduction algorithm. - **Decision Trees**. The architecture type that models decisions, outcomes, and predictions using a flowchart-like tree structure, commonly used for classification and regression tasks. - **K-Nearest Neighbors**. The architecture model that uses proximity to form classifications or predictions about the grouping of an individual data point. You can use this architecture for solving both classification and regression problems. - **Naive Bayes**. The architecture model that works on the principle of conditional probability used for predictive modeling and classification tasks. - **Learning Vector Quantization**. Learning Vector Quantization (LVQ) is an algorithm commonly used for statistical classification and pattern recognition. - **Support Vector Machines**. The architecture type used for linear or nonlinear classification, regression, and outlier detection tasks, where the algorithm creates a line or a hyperplane that separates the data into classes. - **Others**. If none of the other options meet your requirements, select this option.
Libraries	Optional. Enter the software libraries used to build the AI model.

Property	Description
Model Format	Optional. Select the format in which you maintain the asset. You can select one of the following options: - **Docker**. Use Docker to create an operating system bundle with a deep learning environment and package it as a single Docker image. - **ONNX**. Open Neural Network Exchange (ONNX) is an open format that represents machine learning models and facilitates interchanging models between various ML frameworks and tools. - **Others**. If none of the other formats meet your requirements, select this option.
Source Model Repository	Optional. Enter the repository where the source of the AI model is maintained.
Drift	Optional. Enter the drift score. The drift score is the measure of degradation of the model. A higher value indicates greater degradation. Use the drift score to determine whether the model can provide results within an acceptable range of accuracy.
Bias	Optional. Enter the bias score. The bias score is the measure of bias in the model. A higher value indicates a greater difference between the predicted result and the actual result. Use the bias score to determine whether the assumptions in the model are correct.

4. To assign stakeholders to the asset, click the Add icon in the **Stakeholders** section.
5. In the **Modify Stakeholders** dialog box, select a role, and then select the users or user groups that you want to add as stakeholders to the asset. Click **OK**.
6. Click **Create**.
7. If the organization administrator has granted your user role the required privileges to create or modify assets, the system creates the asset in the `Draft` state. Click **Submit** to start the workflow defined for the asset.

   The system creates a ticket for the asset and notifies the stakeholders. For more information about workflow approvals, see the *Asset Management* help.

Creating an AI System asset

In Data Governance and Catalog, create an AI System asset for the interactive shopping assistant. This asset represents the shopping assistant that GamesRUS uses, which helps users by understanding their queries. The assistant provides users with product recommendations, answers their questions, and guides them through the shopping experience.

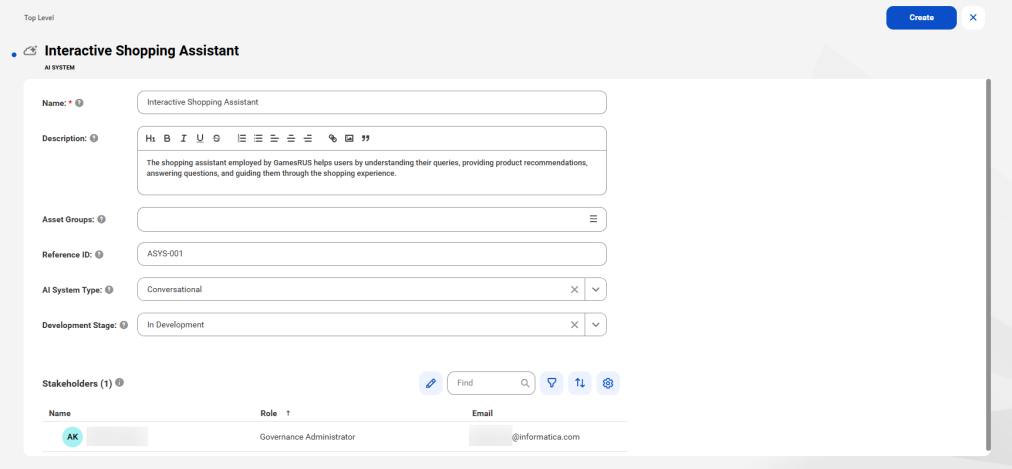

The following prerequisites apply if you want to create assets:

- The organization administrator grants you the **Create** permission for the AI System asset type through access policies in Metadata Command Center.
- To assign stakeholders to the asset, the organization administrator grants you the **Manage Access** permission on the asset through access policies in Metadata Command Center.

For more information about the available privileges and permissions that the organization administrator can enable, see the *Asset Management* help.

1. In Data Governance and Catalog, go to the **Home** page, and click **New**.

2. In the **New** dialog box, select **AI System**.

3. On the new asset page, enter the required properties of the asset.

   The following table describes the properties that you can configure for the AI System asset:

Property	Description
Name	Required. Enter `Interactive Shopping Assistant` as the name of the AI System asset.
Description	Optional. Enter the description of the asset. You can also add images that are less than 1 MB.
Asset Groups	Optional. One or more groups of assets that you can assign to this asset. You can use asset groups in access policies to control access to assets.
Reference ID	Optional. Unique identifier that you can provide for the asset. If you don't provide the reference ID, the system automatically generates a reference ID for the business asset. For more information about reference ID for business assets, see the *Asset Management* help.
AI System Type	Optional. Select the type of AI system. You can select one of the following options: - **AI Application**. A software program that uses artificial intelligence techniques to perform specific tasks. - **AI Agent**. An autonomous AI entity designed to take action within a particular environment to achieve specific goals. - **Retrieval System**. An AI system that searches and retrieves relevant data in response to queries. - **Conversational**. An AI system, such as a chatbot or virtual assistant, that interacts with users through natural language dialogue.
Development Stage	Optional. Select the phase in the AI system lifecycle. During this stage, you might perform data preparation, model design, training, and validation to build and improve the AI system's performance. You can select one of the following options: - **In Development**. The AI system is in development. - **Validation**. The AI system is being validated. - **Production**. The AI system is already in use.

4. To assign stakeholders to the asset, click the Add icon in the **Stakeholders** section.

5. In the **Modify Stakeholders** dialog box, select a role, and then select the users or user groups that you want to add as stakeholders to the asset. Click **OK**.
6. Click **Create**.
7. If the organization administrator has granted your user role the required privileges to create or modify assets, the system creates the asset in the `Draft` state. Click **Submit** to start the workflow defined for the asset.

   The system creates a ticket for the asset and notifies the stakeholders. For more information about workflow approvals, see the *Asset Management* help.

Defining evaluation metrics

In Metadata Command Center, define metrics that help you evaluate the LLMs sourced from outside your organization.

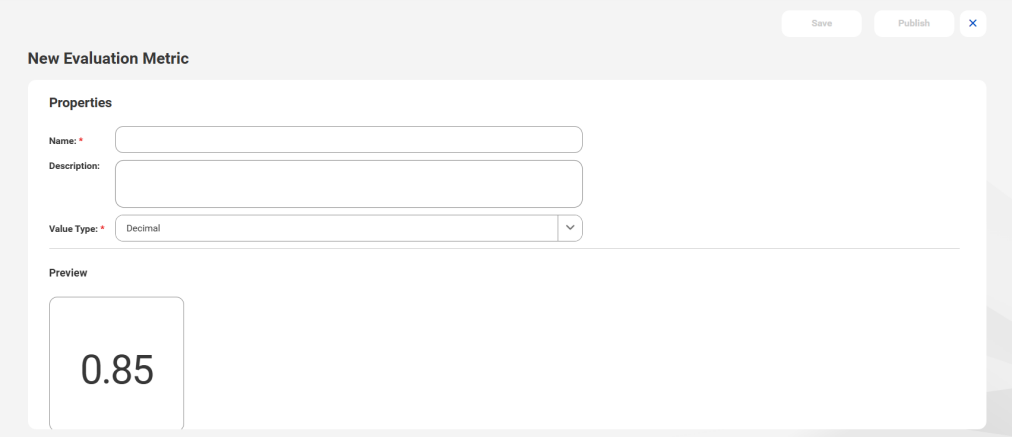

To create, modify, or delete evaluation metrics, define appropriate roles and, in Administrator, select the **Manage Custom Attributes** privilege for that role when you configure privileges for Metadata Command Center. For more information about the available privileges and permissions that the organization administrator can enable, see the *Introduction and Getting Started* help in Metadata Command Center.

1. In Metadata Command Center, open the **Customize** page.
2. On the **Customize** page, go to the **Asset Customization** tab.
3. In the **Asset Types** panel, select the **AI Model** asset type.
4. In the **Details: AI Model** section, go to the **Evaluation Metrics** tab.

5. Click the **Add** icon.

Alternatively, you can click **Create** to add a new evaluation metric.

6. Configure the following properties of the new evaluation metric:

Property	Description
Name	Unique name for the evaluation metric that appears in Data Governance and Catalog. Ensure that the metric name doesn't match a name that already exists. To accurately assess the LLMs from an external source system, you identified the following metrics: • **Error rate**. Measures the frequency of incorrect or irrelevant responses. Includes failure to understand queries or inability to provide helpful answers. • **Intent recognition accuracy**. Measures how accurately the model understands and responds to users' shopping intents. • **Query adaptability**. Measures how the model performs with diverse inputs, including typos, slang, or ambiguous queries. • **Response latency**. Measures the time taken by the model to generate replies.
Description	Description of the evaluation metric.
Value Type	Type of value that users can enter in the metric. You can choose one of the following value types: • Decimal • Integer • Percentage Default is **Decimal**.

7. Click **Save**.

   The system creates a draft version of the new evaluation metric that you can view in the metrics list on the **Evaluation Metrics** tab.

8. Click the name of the evaluation metric that you saved to view and verify the details of the metric. To modify the properties of the metric, edit the values and click **Save**.

   Note: If you don't want to proceed with your changes, you can use the **Discard** icon to discard the draft version of the evaluation metric. You can also perform this action from the Action menu on the **Asset Customization** > **Evaluation Metrics** tab of the **Customize** page. On the **Asset Customization** > **Evaluation Metrics** tab, you can also discard the draft version of multiple evaluation metrics. To discard multiple draft metrics, select the evaluation metrics for which you want to discard the draft state and click the **Discard** icon from the Action menu.

9. Click **Publish** to publish the metric in Data Governance and Catalog.

   The system initiates the **Attributes Publish** job to publish your changes. If another job to create, modify, or delete an attribute, evaluation metric, or relationship is active, the system informs you of the active job. To publish your changes, wait until the active job completes. To monitor the status of the job, click **View Status** on the **Job Monitoring Overview** page.

   Note: The system displays an error if the previous job has failed. At this stage, resolve the errors, reinitiate the previous job, and wait for it to finish before you can start your own job.

   After the publishing is successful, the lifecycle state of the evaluation metric changes from **Draft** to **Published**.

The new metric appears on the **Overview** page of all AI Model assets in Data Governance and Catalog.

Creating AI models from technical assets

After you identify an AI Model technical asset that is suitable for replacing the shopping assistant's underlying LLM, you can create a corresponding AI Model business asset from it.

The following prerequisites apply if you want to create an AI model asset from an AI Model technical asset:

- The organization administrator grants you the **Create** permission for the AI Model business asset through access policies in Metadata Command Center.
- To establish associations between the AI Model and Data Set assets, the organization administrator grants you the **Update** permission for the AI Model business asset, Data Set business asset, and the AI Model technical asset through access policies in Metadata Command Center.
- To assign stakeholders to the asset, the organization administrator grants you the **Manage Access** permission on the asset through access policies in Metadata Command Center.

1. In Data Governance and Catalog, open the AI Model technical asset for which you want to create an AI Model business asset.
2. On the AI Model asset page, click **Create AI Model**.
3. On the **Overview** tab of the **New AI Model** wizard, configure the properties of the AI Model asset that you want to create.

   The following table describes the fields that you can configure for the new AI Model asset:

Field	Description
Name	Name of the AI model.
Description	Functional definition of the AI model. The size of the field can't exceed 1 MB.
Asset Groups	Asset group of the AI model. You can use asset groups in access policies to control access to assets.
Reference ID	Unique reference identifier for the AI model.

4. To assign stakeholders to the AI model, click the Add icon in the **Stakeholders** section.
5. In the **Modify Stakeholders** dialog box, select a role, and then select the users or user groups that you want to add as stakeholders to the asset. Click **OK**.
6. Click **Next**.
7. On the **Metrics** tab of the **New AI Model** wizard, select the evaluation metrics that you defined for the AI model. You can use the static value that the system scanned from the source or manually enter a value.

8. To create a new AI Model asset, click **Create**.

   If the AI Model technical asset has more than 20 associated data sets, the system associates a maximum of 20 data sets when you use the technical asset to create an AI Model business asset. You can add the remaining associations after you create the AI Model business asset.

Result

After you create an AI Model business asset from the AI Model technical asset, use the metrics that you defined to assess the newly created business asset.

Interact with stakeholders to determine whether the new version of the LLM is suitable for the shopping assistant. For more information about collaborating on assets, see the *Asset Management* help in Data Governance and Catalog.

If the stakeholders approve the usage of the new AI Model asset, establish a relationship between the AI Model asset and the Interactive Shopping Assistant AI System asset. For more information about creating relationships between assets, see the *Asset Discovery* help.
