Overview

Introduction

Data Governance and Catalog helps you understand, analyze, interpret, and govern large volumes of data in your organization. Microsoft Teams is a cloud-based instant messaging service that helps you communicate through text messages, file and media shares, and voice and video calls. You can now search and view assets that are available in Data Governance and Catalog from Microsoft Teams using public APIs.

Why use Microsoft Teams with Data Governance and Catalog?

Let's explore some of the benefits of searching and viewing data assets from Data Governance and Catalog in Microsoft Teams:

- A Data Governance and Catalog user can search and utilize data assets from within Microsoft Teams instantly for immediate business impact.
- Provides a single platform for consolidating internal business communication and catalog search services. Users can discover or explore data assets without leaving Microsoft Teams.
- Allows you to limit catalog visibility to required or authorized collaborators only.

Prerequisites

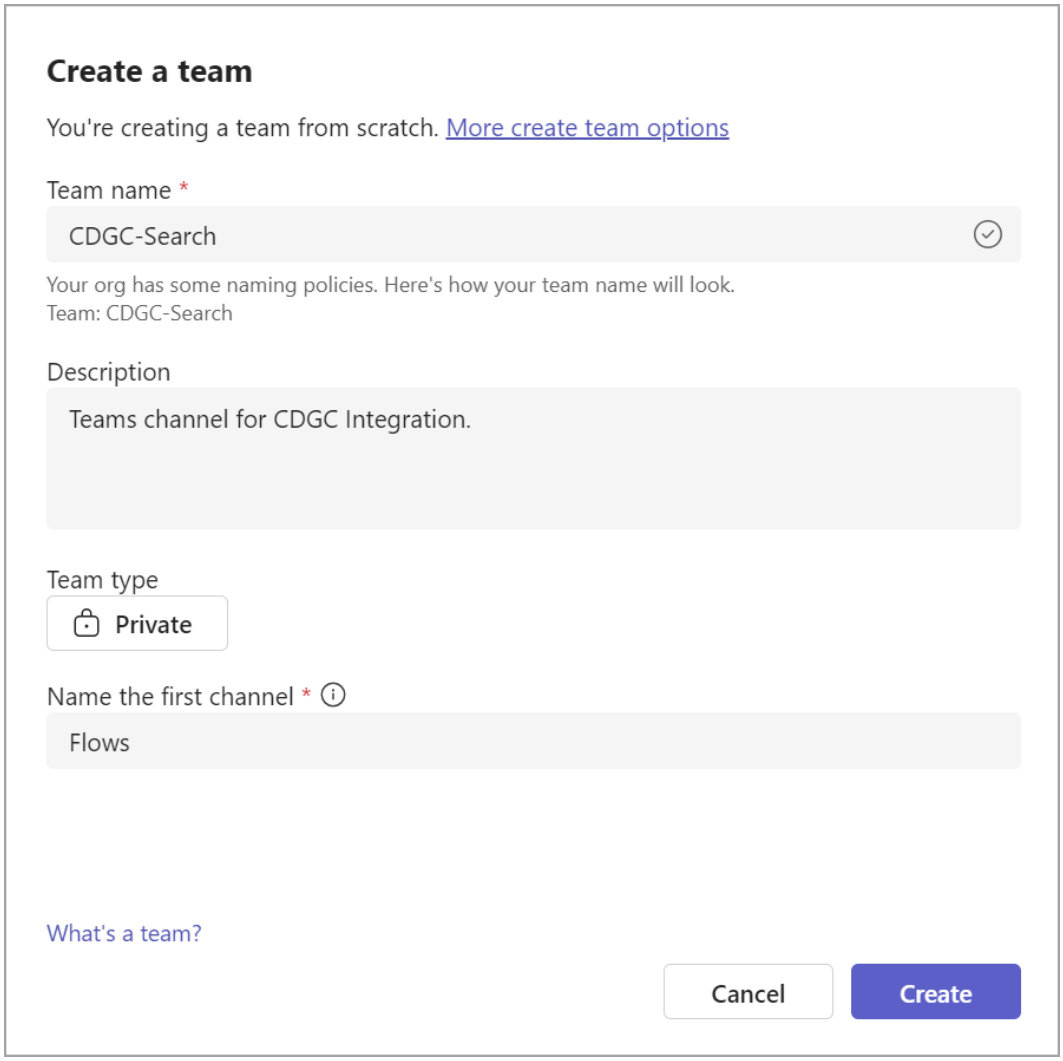

Before you begin, verify that you have installed an automated workflow tool to connect Data Governance and Catalog with Microsoft Teams. You can use any automated workflow tool of your choice, such as Microsoft Power Automate, a Python-based tool, or Java-based tool.

Note: In this document, we will use Microsoft Power Automate to connect Microsoft Teams to Data Governance and Catalog. To simplify your experience with using Microsoft Power Automate, you can use the sample template package provided in the Knowledge Base article 000215557.

Creating a Microsoft Teams private team

Create a private team in Microsoft Teams. This private team will be your gateway to Data Governance and Catalog. To search for the Data Governance and Catalog assets, open this team and use the required search keywords.

1. Go to Microsoft Teams.
2. On the **Teams** tab, click **Create and join teams and channels**.
3. In the **Create and join teams and channels** menu, click **Create team**.
4. In the **Create a team** dialog box, enter the details of the private team that you want to create.

Configure Microsoft Power Automate

Configure Microsoft Power Automate to facilitate the connection between Microsoft Teams and Data Governance and Catalog.

Creating a flow

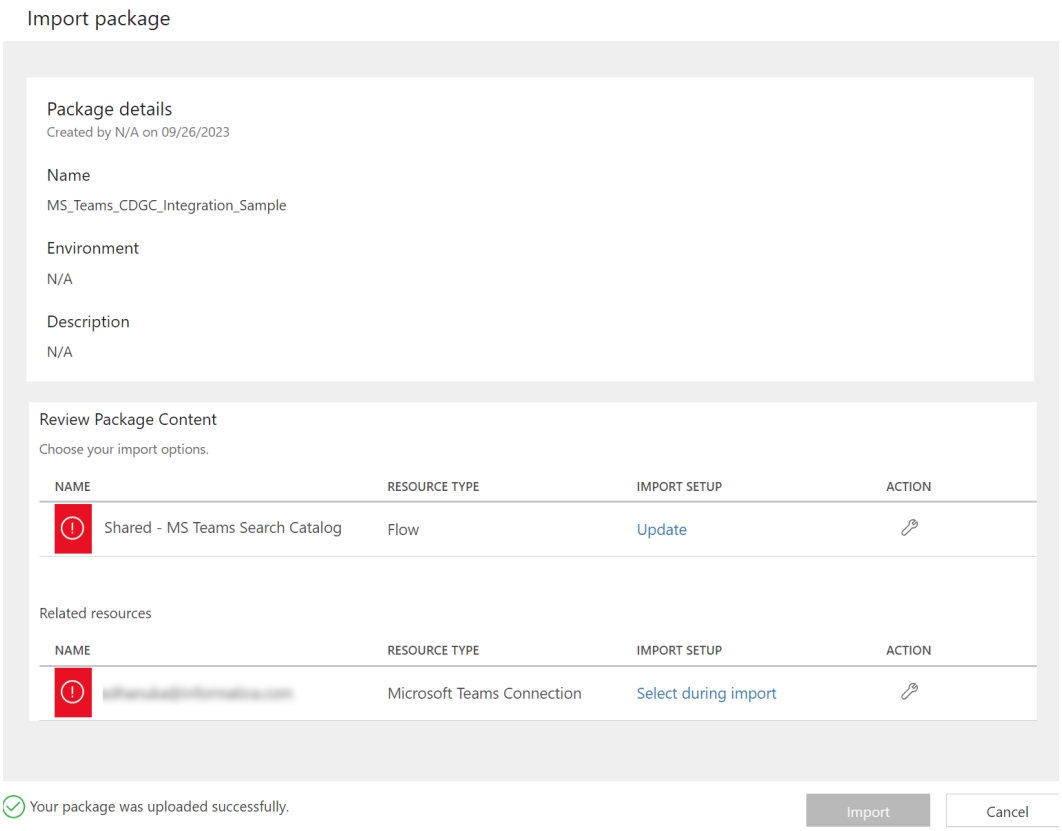

Create a flow to connect Microsoft Teams to Data Governance and Catalog. A flow in Microsoft Power Automate is a set of predefined tasks or processes that run sequentially. A flow can be triggered automatically, on a schedule, or by an event such as sending a message on a Microsoft Teams channel.

1. Go to https://make.powerautomate.com.
2. In Microsoft Power Automate, go to **My Flows** > **Import Package**.
3. On the **Import Package** page, select the package file that you want to import from your local computer and click **Upload**.

   You can also upload the sample template package that is provided by Informatica. For more information about the sample template package, see "Prerequisites" on page 2.

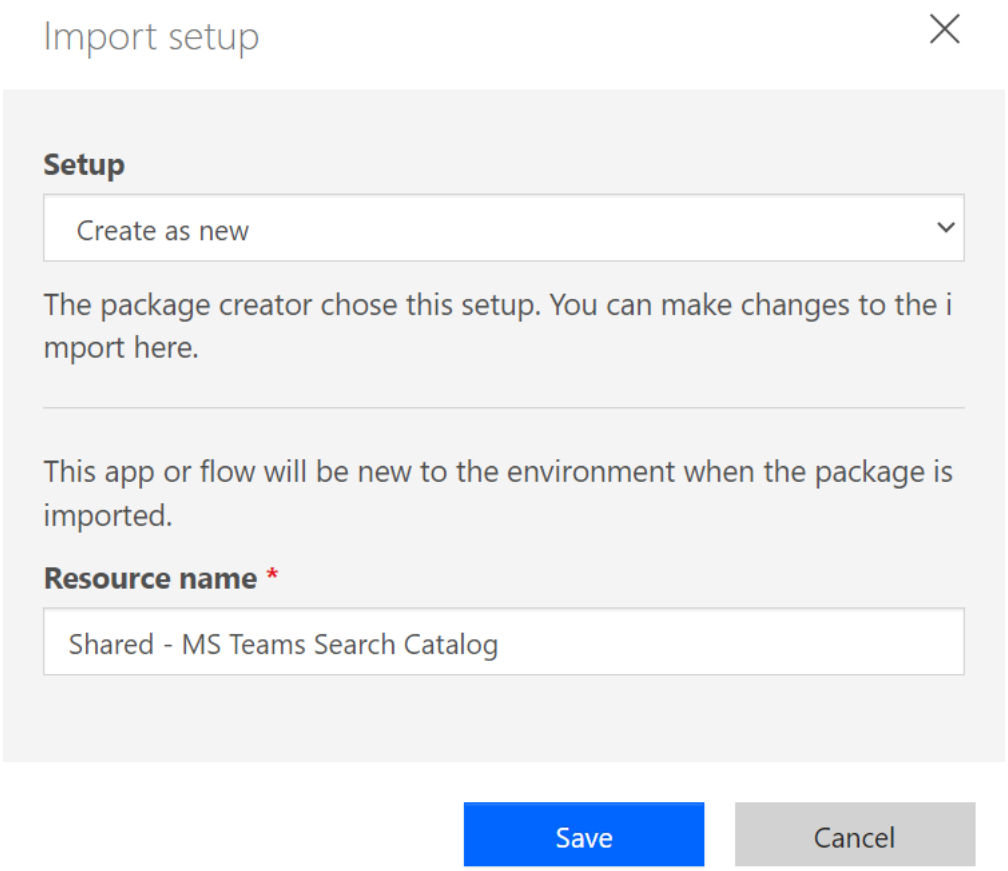

4. In the **Review Package Content** section on the **Import Package** page, click the Action menu.

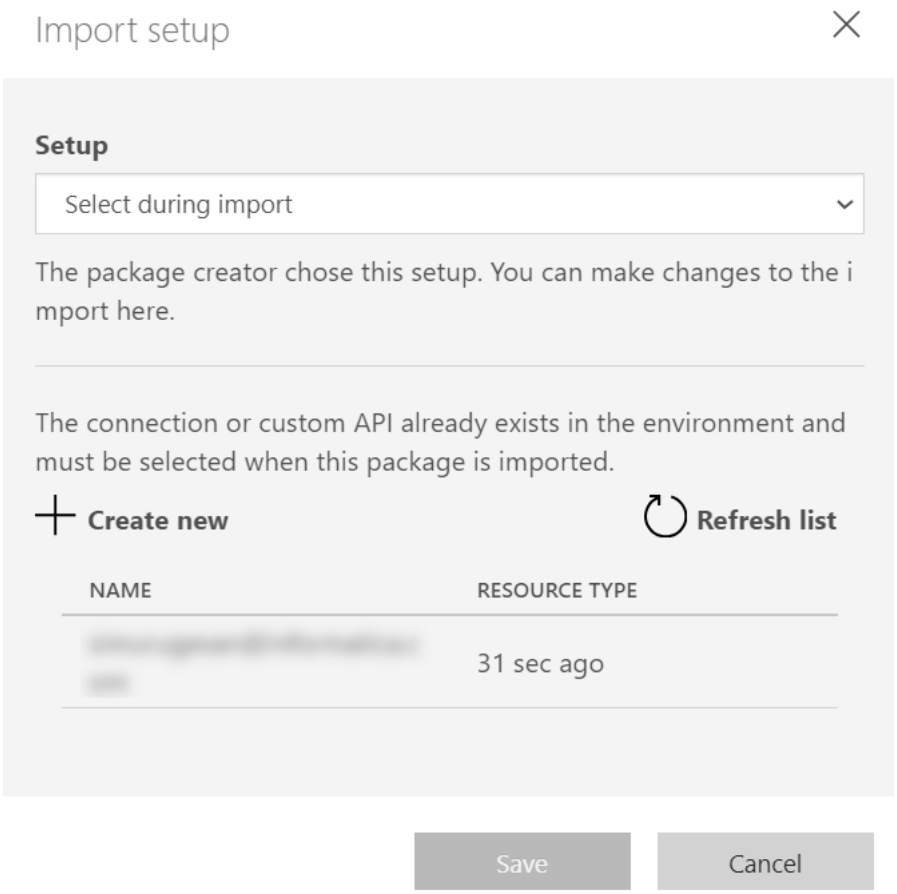

5. In the **Setup** field on the **Import setup** dialog box, select `Create as new`.

   To modify the name of the flow that you want to create, use **Resource name** field on the **Import setup** dialog box.

6. Click **Save**.
7. In the **Related resources** section on the **Import Package** page, and click the Action menu.
8. In the **Import setup** dialog box, select the connection to Microsoft Teams.

a. If you have no preexisting connections to Microsoft Teams or if you want to create a new connection, click **Create new**.

b. On the **Connections** page, click **New connection**.

c. In the **Connections** > **New connection** menu, click the Microsoft Teams connection and click **Create**.

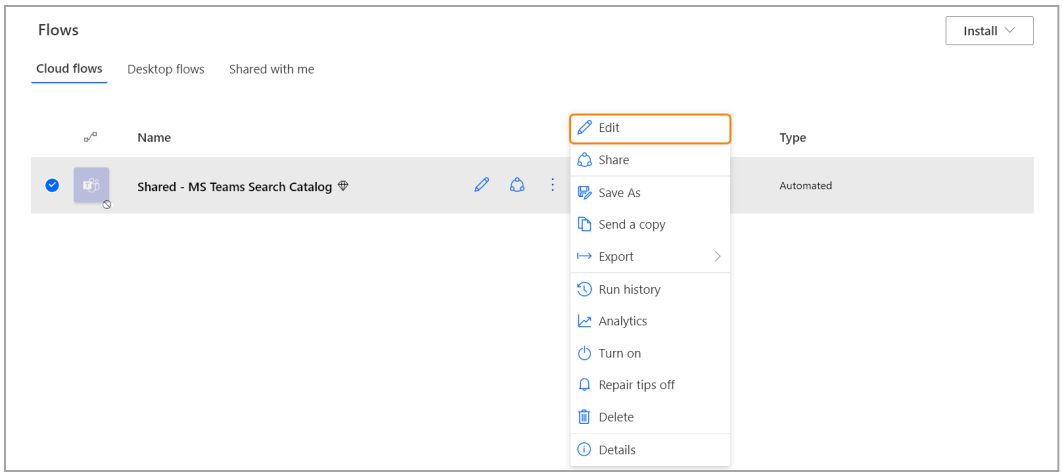

9. On the **Import Package** page, click **Import** to create the flow.

After the flow is created, you can activate the flow. For more information about how you can activate the flow, see "Activating the flow" on page 8.

Activating the flow

Activate the flow to establish the connection between Microsoft Teams and Data Governance and Catalog.

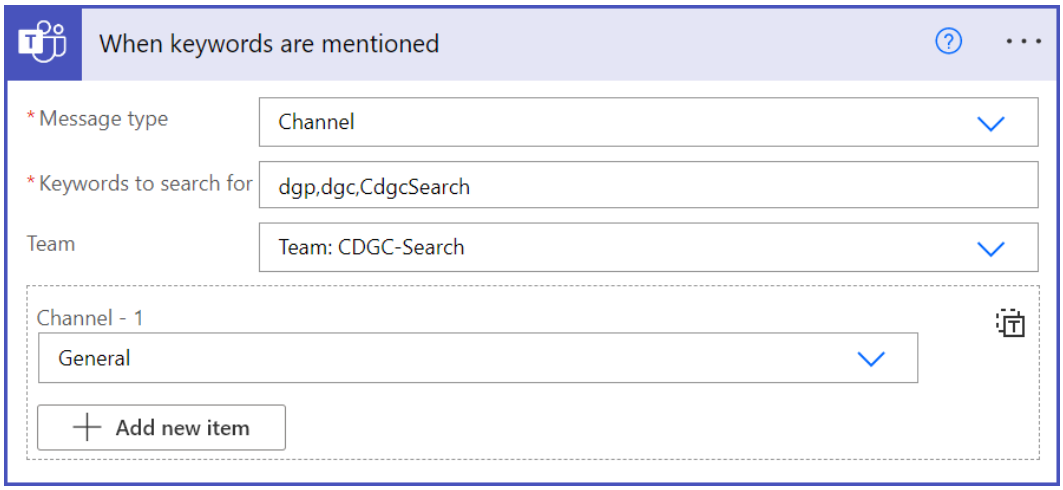

1. On the **My Flows** tab in Microsoft Power Automate, click the Action menu next to the flow that you created, and click **Edit**.

2. In the **When keywords are mentioned** section on the **Edit your flow** page, specify the Microsoft Teams channel and the trigger keywords.

   The following table describes the fields that you can configure in the **When keywords are mentioned** section:

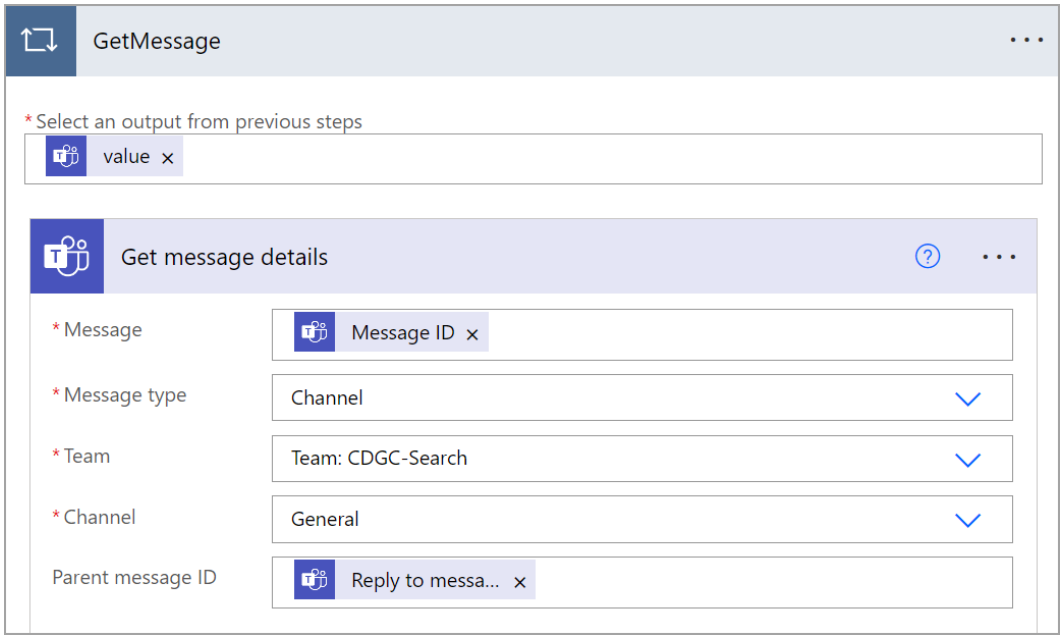

Field	Description
Message type	Configure the flow to send messages to a Microsoft Teams Channel or a group chat. Select `Channel`.
Keywords to search for	Specify a list of trigger keywords that you can use in Microsoft Teams to search for assets in Data Governance and Catalog. When you search for assets, you can use the trigger keywords that you entered, followed by your search phrase. For more information about how you can use trigger keywords, see "Examples of search queries" on page 22.
Team	Select the private team that you created. For more information about how you can create a private team, see "Configure your Microsoft Teams private team" on page 13.
Channel	Select the channel in the private team that you selected. For example, `General`.

3. In the **Get message details** section on the **Edit your flow** page, specify the Microsoft Teams channel in the private team that you created.

   The following table describes the fields that you can configure in the **Get message details** section:

Field	Description
Message type	Configure the flow to send messages to a Microsoft Teams Channel or a group chat. Select `Channel`.
Team	Select the private team that you created. For more information about how you can create a private team, see "Configure your Microsoft Teams private team" on page 13.
Channel	Select the channel in the private team that you selected. For example, `General`.

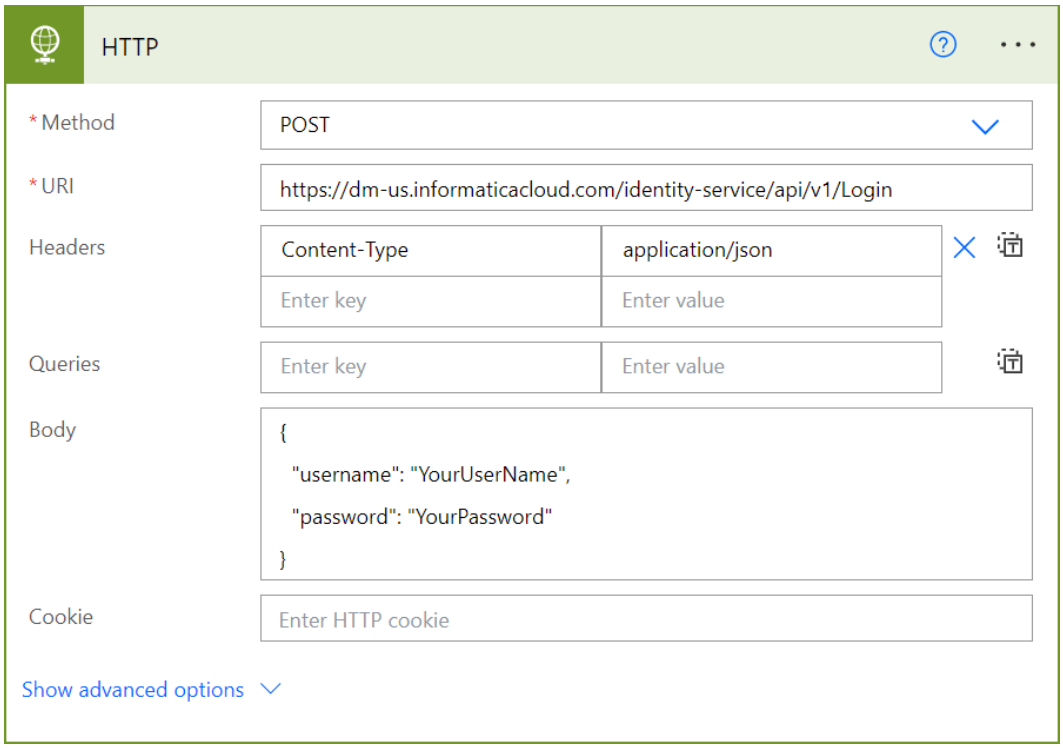

4. In the **HTTP** section, specify your Informatica Intelligent Cloud Services login information and your organization's Informatica Intelligent Cloud Services URI.

   The following table describes the fields that you can configure in the **HTTP** section:

Field	Description
Method	Specify the HTTP method to be used to invoke the web service. Select `POST`.
URI	Enter the Informatica Intelligent Cloud Services login URL based on the region, such as `https://dm-us.informaticacloud.com/identity-service/api/v1/Login`, `https://dm-em.informaticacloud.com/identity-service/api/v1/Login`, `https://dm-ap.informaticacloud.com/identity-service/api/v1/Login`, `https://dm-uk.informaticacloud.com/identity-service/api/v1/Login`, and so on.
Headers	Specify `Content-Type: application/json`.

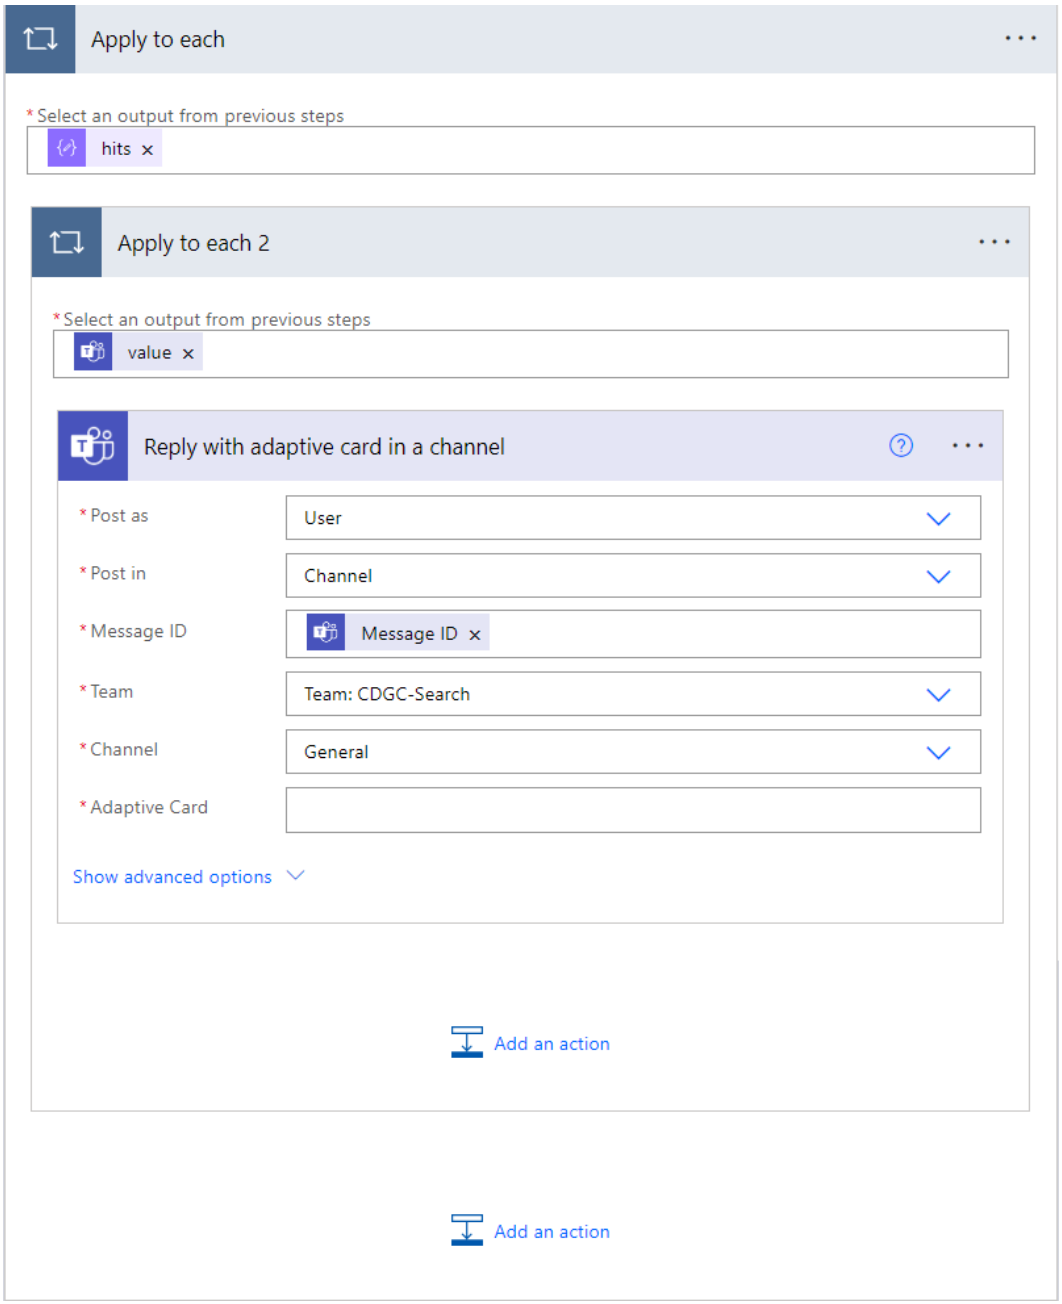

Body	Enter the Informatica Intelligent Cloud Services login information.
	To specify the login information, use the following format:
	`{`
	`"username": <IICS username>`
	`"password": <IICS password>`
	`}`

5. In the **Reply with adaptive card in a channel** subsection in the **HTTP** section, specify the Microsoft Teams channel in the private team that you created.

The following table describes the fields that you can configure in the **Reply with adaptive card in a channel** subsection:

Field	Description
Team	Select the private team that you created. For more information about how you can create a private team, see "Configure your Microsoft Teams private team" on page 13.
Channel	Select the channel in the private team that you selected. For example, `General`.

6. Click **Save**.
7. On the **My Flows** tab, click the Action menu next to the package, and click **Turn on**.

The flow is activated, and the connection between Data Governance and Catalog and Microsoft Teams is established. You can now use the trigger keywords that you configured in Microsoft Power Automate to search for Data Governance

and Catalog assets in Microsoft Teams. For more information about how you can search for Data Governance and Catalog assets in Microsoft Teams, see "Searching for catalog assets in Microsoft Teams" on page 21.

Configure your Microsoft Teams private team

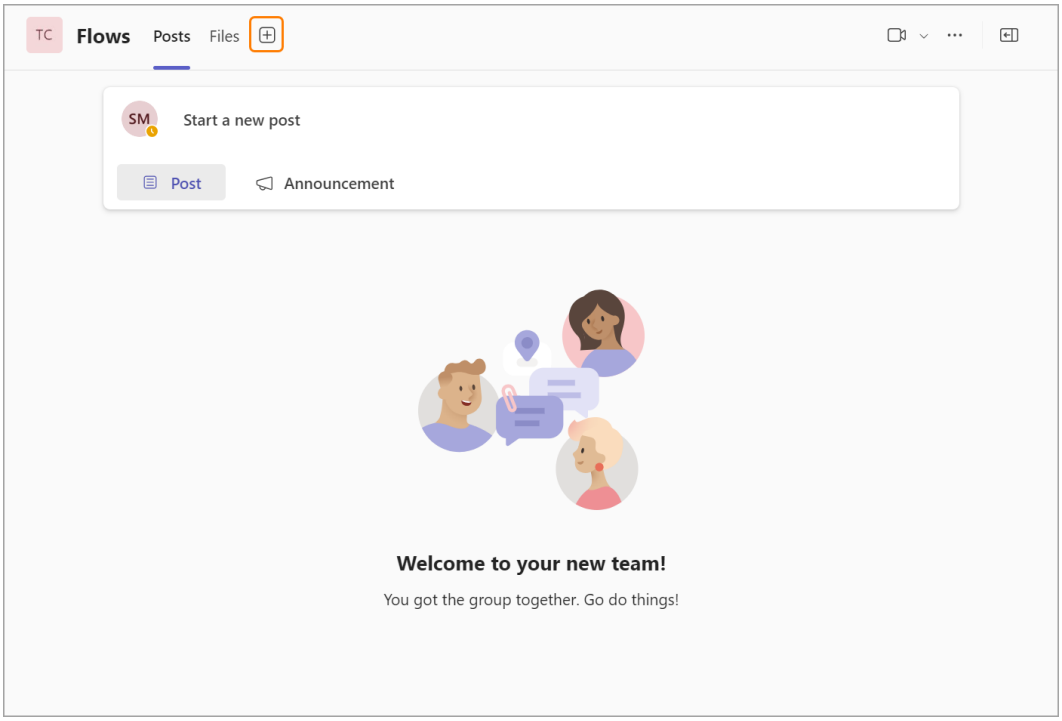

Configure the private team that you created in Microsoft Teams to enable it to receive data from Data Governance and Catalog.

Enabling a workflow for webhook requests

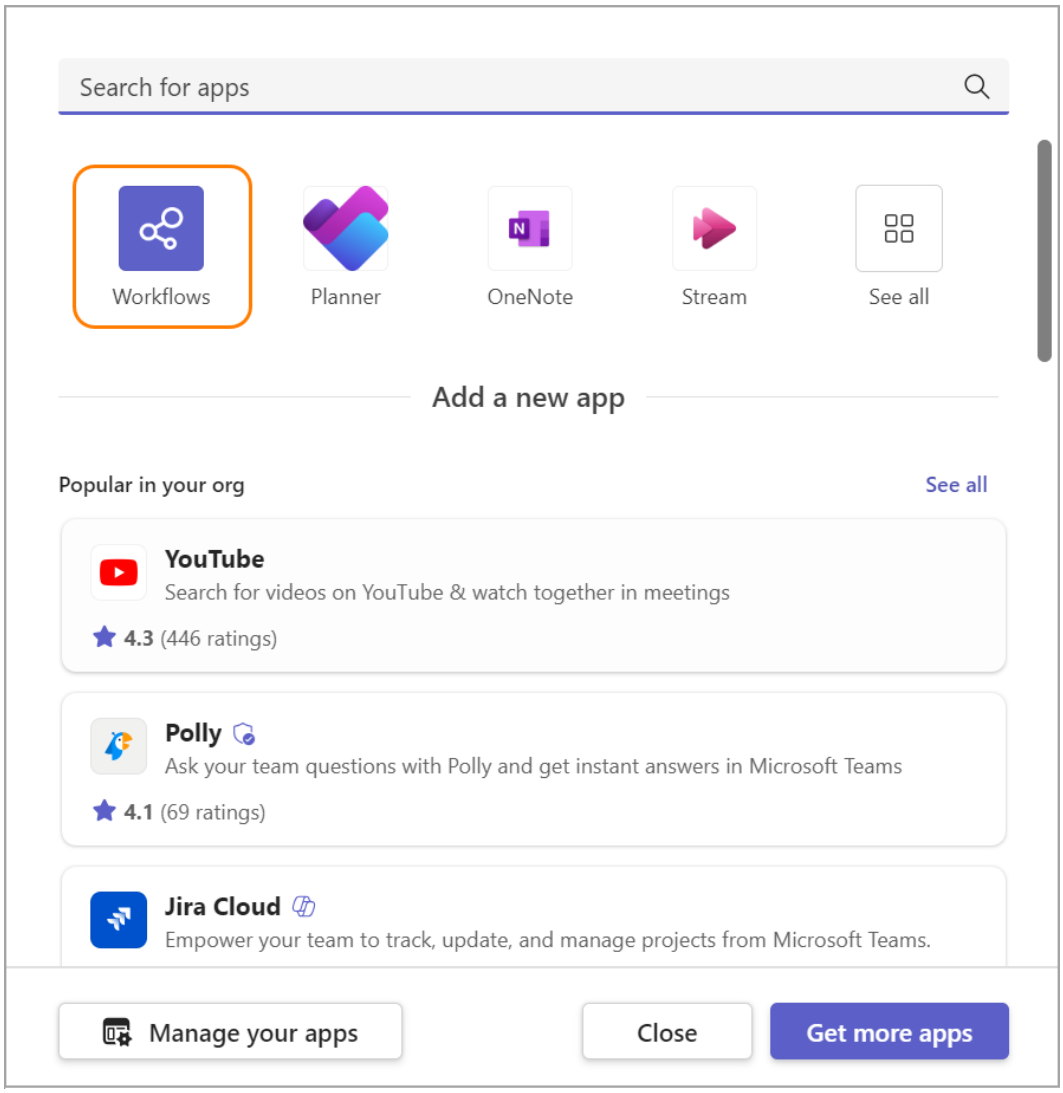

Enable a workflow in Microsoft Teams that allows Microsoft Power Automate to interface with the private team that you created.

Ensure that you have already created a flow in Microsoft Power Automate. For more information about how you can create a flow, see "Configure Microsoft Power Automate" on page 4.

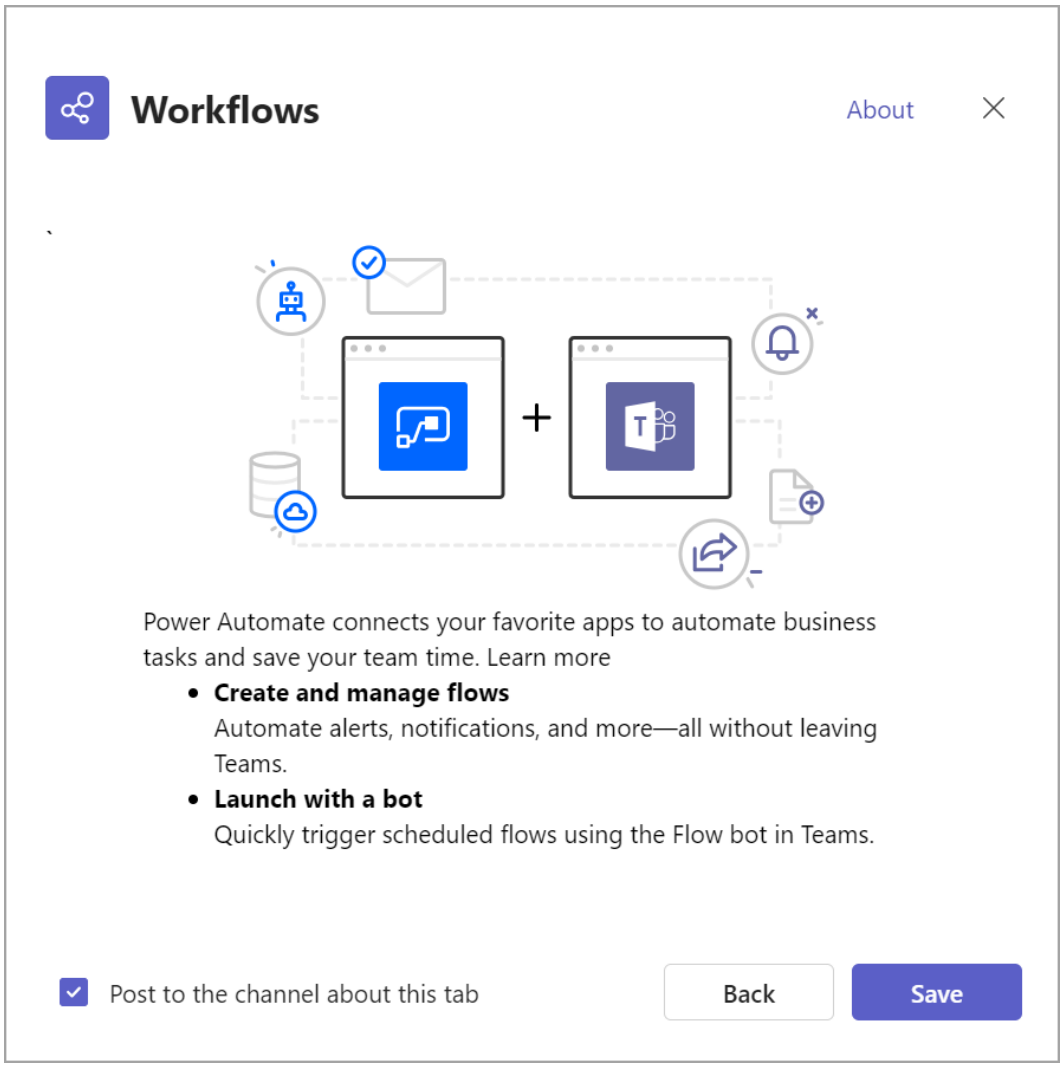

1. On the **Teams** tab in Microsoft Teams, select the team that you created.
2. On the team page, click the **Add a tab** icon.

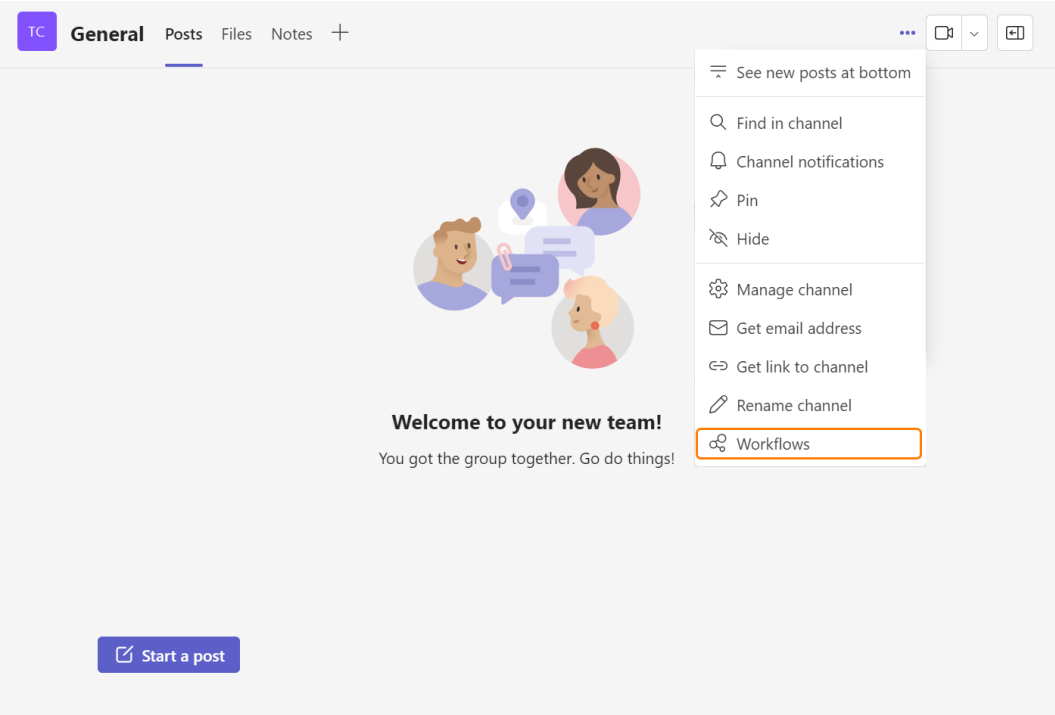

3. In the **Apps** dialog box, select the **Workflows** app.

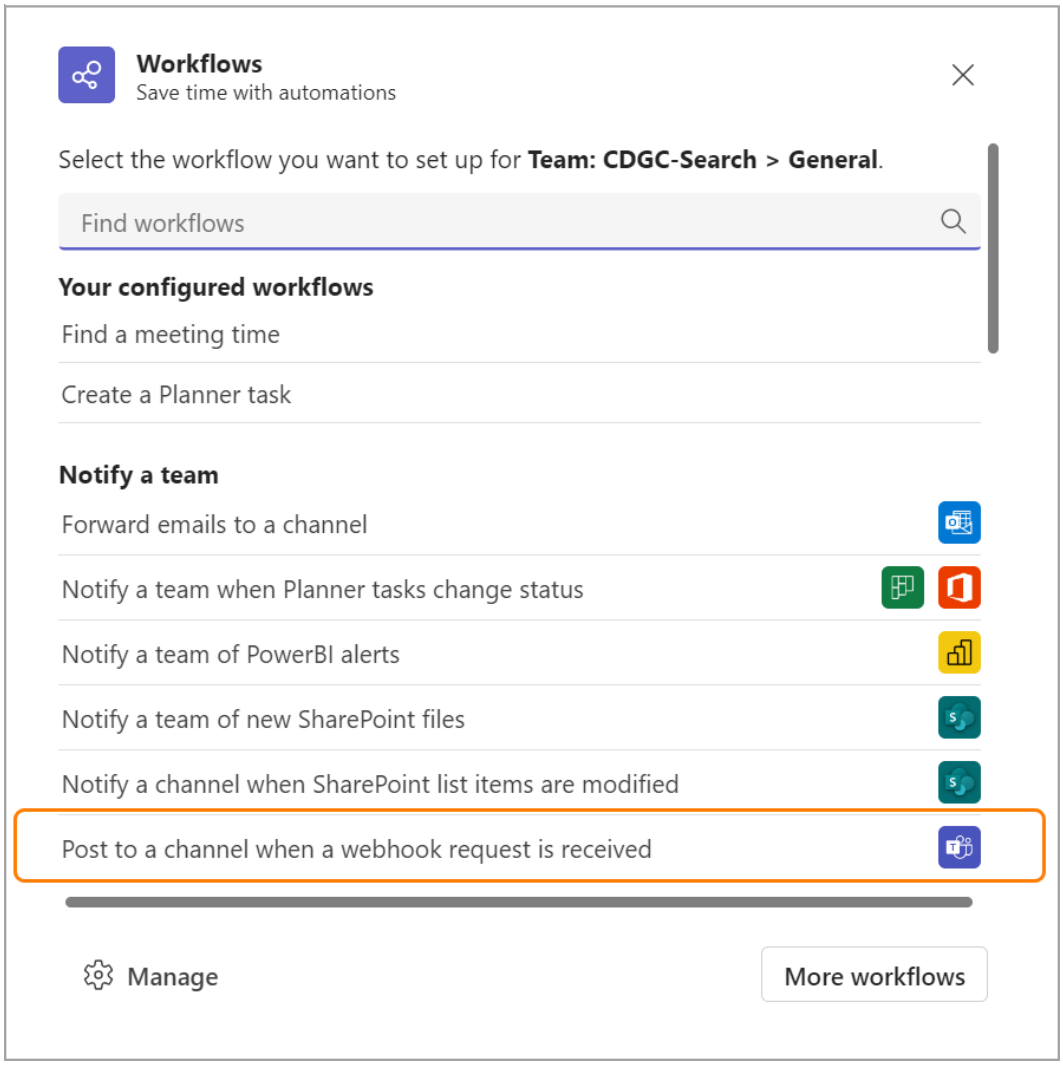

4. To add the **Workflows** app, select the **Post to channel about this tab** option and click **Save**.

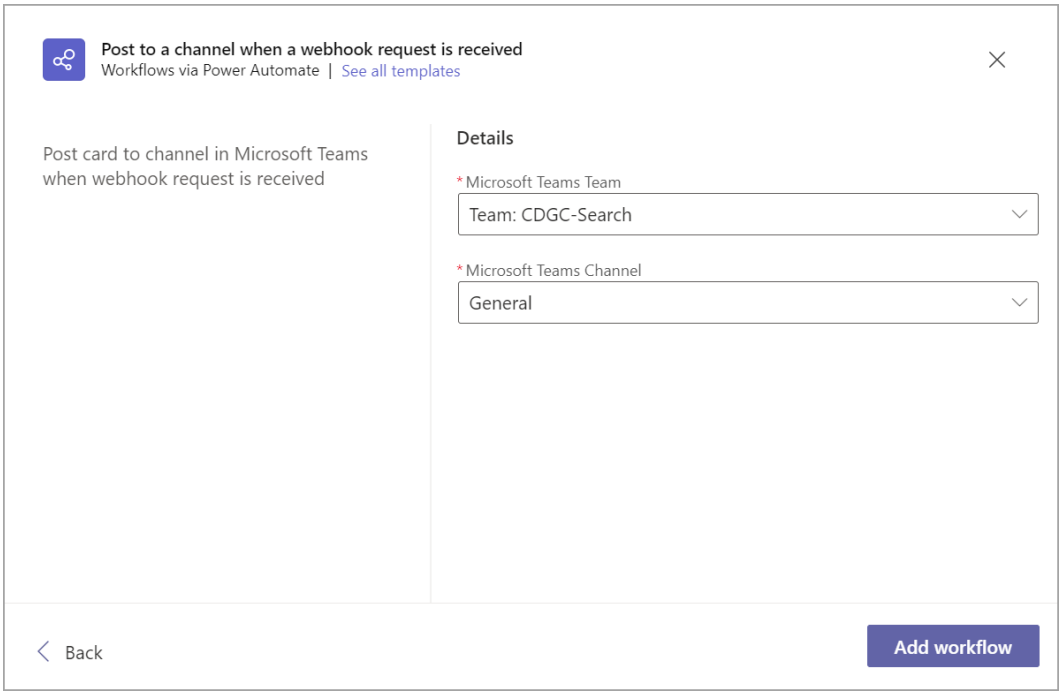

5. Open the team page, click the Action menu and select **Workflows**.

6. In the **Workflows** dialog box, select **Post to a channel when a webhook request is received**.

Workflows
Save time with automations
Select the workflow you want to set up for **Team: CDGC-Search > General**.
Find workflows
Your configured workflows
Find a meeting time
Create a Planner task
Notify a team
Forward emails to a channel
Notify a team when Planner tasks change status
Notify a team of PowerBI alerts
Notify a team of new SharePoint files
Notify a channel when SharePoint list items are modified
Post to a channel when a webhook request is received
Manage
More workflows

7. Verify the private team details and add the **Post to a channel when a webhook request is received** workflow.

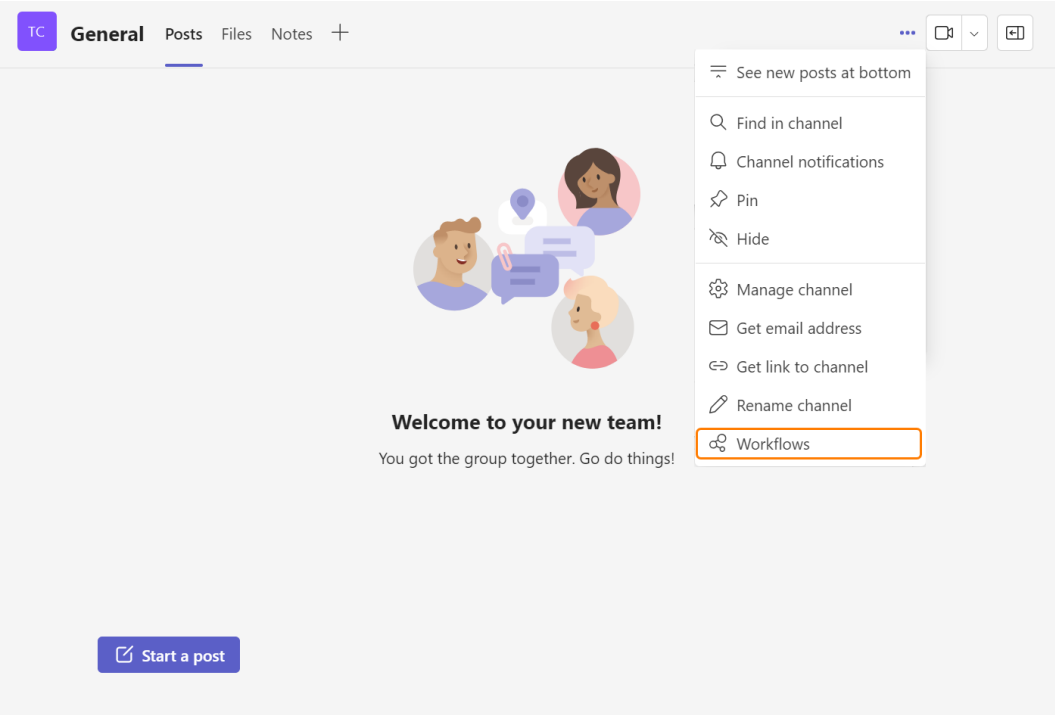

Enabling the Microsoft Power Automate flow

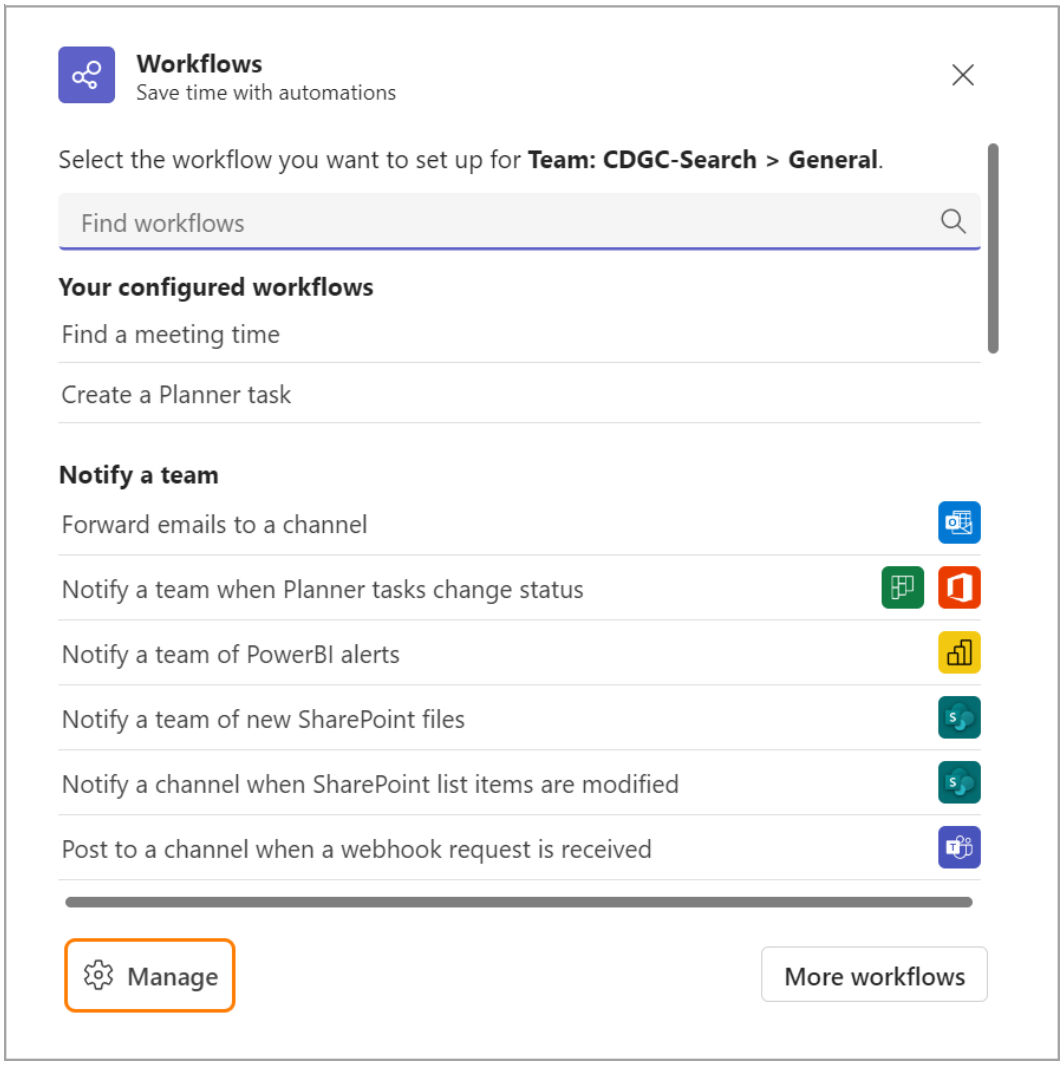

In Microsoft Teams, enable the Microsoft Power Automate flow that you created to allow Data Governance and Catalog to send data to Microsoft Teams.

Ensure that the flow that you want to enable is already exists in Microsoft Power Automate. For more information about how you can create a flow, see "Configure Microsoft Power Automate" on page 4.

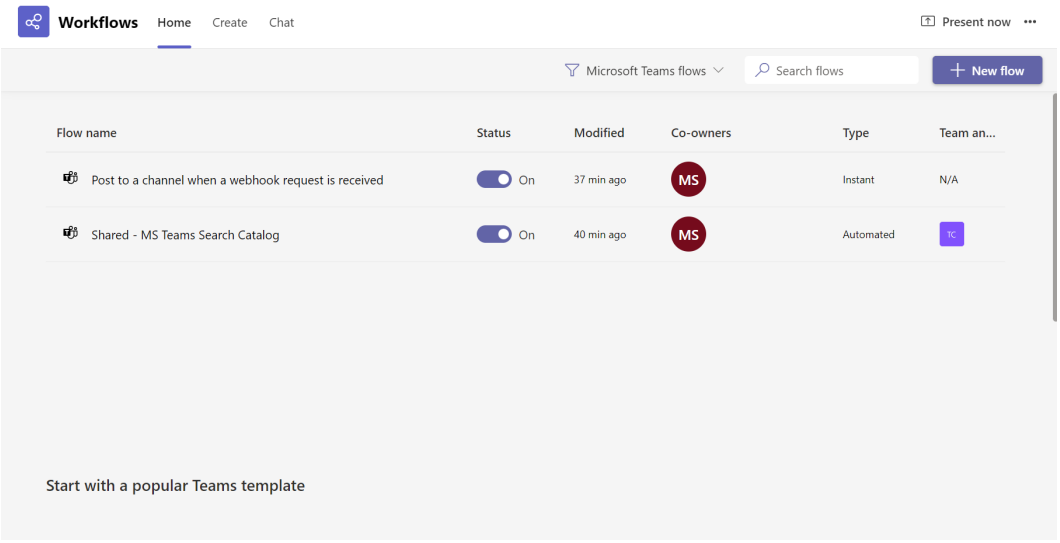

1. On the **Teams** tab in Microsoft Teams, select the team that you created.
2. On the team page, click the Action icon and select **Workflows**.

3. In the **Workflows** dialog box, click **Manage**.

Workflows
Save time with automations
Select the workflow you want to set up for **Team: CDGC-Search > General**.
Find workflows
Your configured workflows
Find a meeting time
Create a Planner task
Notify a team
Forward emails to a channel
Notify a team when Planner tasks change status
Notify a team of PowerBI alerts
Notify a team of new SharePoint files
Notify a channel when SharePoint list items are modified
Post to a channel when a webhook request is received
Manage
More workflows

4. In the **Workflows** tab, set the status of the flow that you created in Microsoft Power Automate to **On**.

Searching for catalog assets in Microsoft Teams

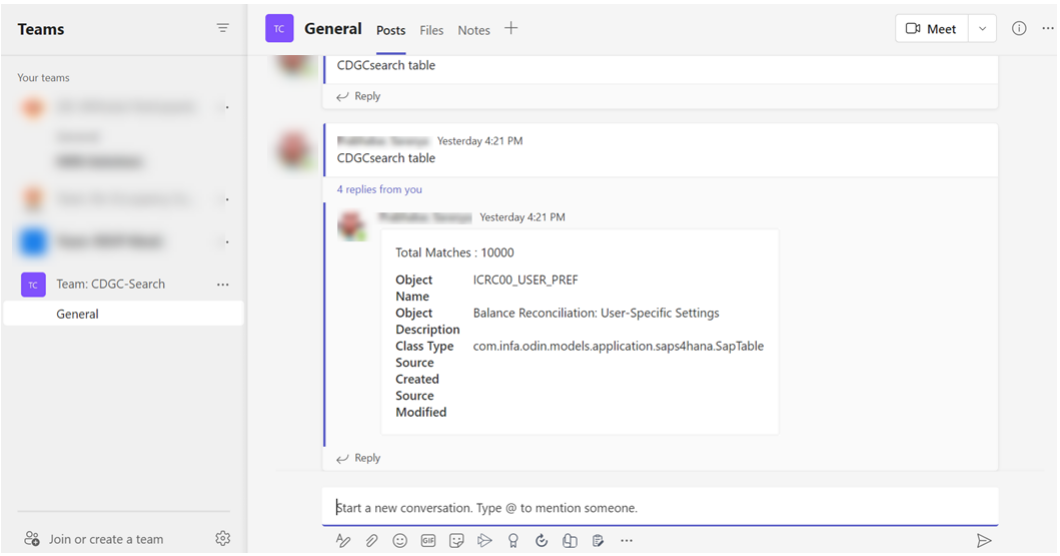

After you have configured Microsoft Power Automate, you can search and view the business or technical assets from Data Governance and Catalog in the Microsoft Teams private team that you created.

1. In Microsoft Teams, go to the private team that you created.

   For more information about how you can create a private team, see "Configure your Microsoft Teams private team" on page 13.

2. In the private team's channel, enter a search query.

   A search query comprises of the trigger keyword that you configured in Microsoft Power Automate and the search phrase that you want to use to look for assets.
   For more information about how you can specify search keywords in Microsoft Power Automate, see "Creating a flow" on page 4.

3. To view an asset in Data Governance and Catalog, click the asset.

Examples of search queries

Here are a few examples about how you can use search queries in Microsoft Teams to search for assets from Data Governance and Catalog.

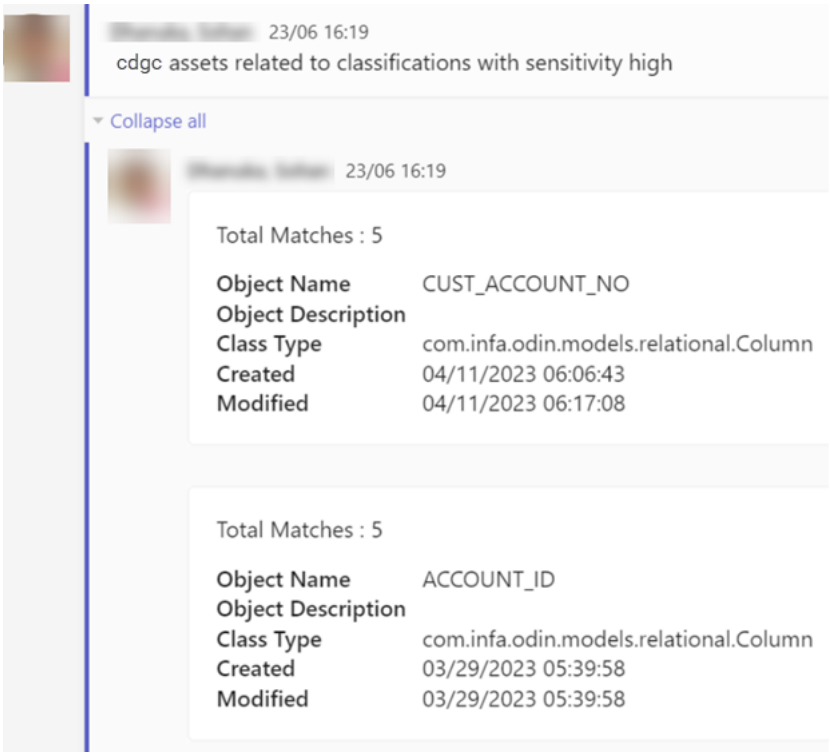

Example 1

To search and view all data classifications that are marked with high sensitivity, enter the following query:

```
cdgc assets related to classifications with sensitivity high
```

In the preceding search query, `cdgc` is the trigger keyword that we had configured in Microsoft Power Automate and `assets related to classifications with sensitivity high` is the search phrase.

The following image shows the search results in Microsoft Teams for the preceding search query:

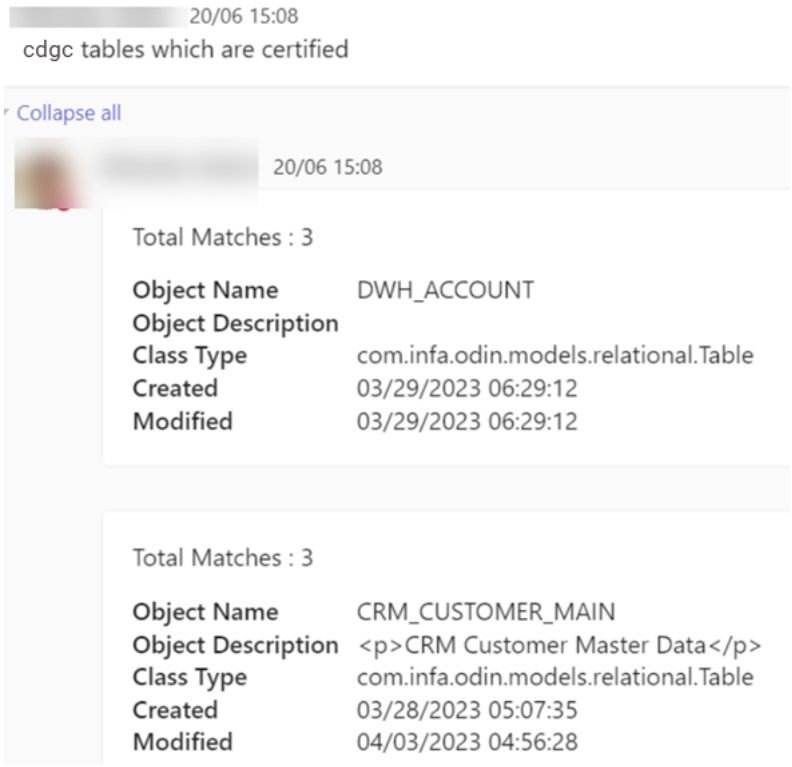

Example 2

To search and view all tables that are certified, enter the following query:

```
cdgc tables which are certified
```

In the preceding search query, `cdgc` is the trigger keyword that we had configured in Microsoft Power Automate and `tables which are certified` is the search phrase.

The following image shows the search results in Microsoft Teams for the preceding search query:

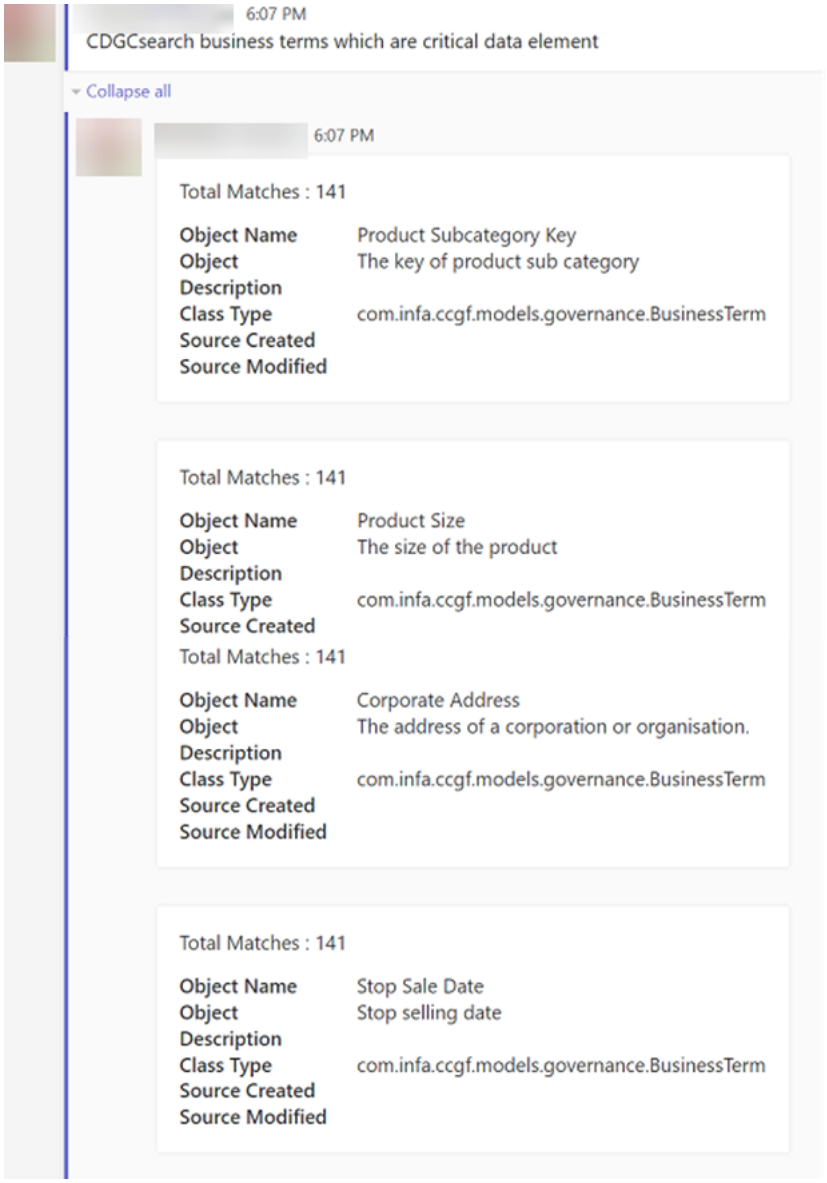

Example 3

To search and view all business terms that are marked as critical data elements, enter the following query:

```
CDGCsearch business terms which are critical data element
```

In the preceding search query, `CDGCsearch` is the trigger keyword that we had configured in Microsoft Power Automate and `business terms which are critical data element` is the search phrase.

The following image shows the search results in Microsoft Teams for the preceding search query:

For more information about search queries, see the *Working With Assets* help.
