Abstract

You can configure the business term association for a resource to automatically associate or recommend the business terms. Minimize manual intervention in associating business terms with technical assets by using automatic business term association. This article explains how to configure a resource to automatically associate business terms with assets and view associated business terms in the catalog.

Supported Versions

- 10.4.1 Enterprise Data Catalog

Overview

You can enable intelligent business term association for a resource when you configure the resource. After you enable the association and run the resource, Enterprise Data Catalog associates the business terms with assets, such as columns, fields, tables, views, and files.

Enterprise Data Catalog infers and associates a business term as the business title of an asset based on the following conditions:

Data Domains with Associated Business Terms

When data domains with associated business terms are inferred for columns, the associated business terms are accepted for the columns.

Column Similarity

If you enable **Similarity Profile and Value Frequency** for a resource and run the resource, Enterprise Data Catalog associates business terms to similar columns. The association is based on name match between business term and column names, unique value match, and data match.

Name Match

If you enable Business Term Association settings for a resource and run the resource, the Enterprise Data Catalog associates business terms based on the name match between assets and business terms.

For more information about the business term association, see the Informatica Enterprise Data Catalog User Guide and Informatica Catalog Administrator Guide .

Tutorial Example

As a data steward in a retail chain, you are required to interact with subject matter experts in the sales department and define the technical metadata of assets in the catalog for ease of identification. You know that the sales department information is included in an Oracle resource called **customer_sales**, and you want other data stewards and data

architects in the retail chain to know that metadata from the **customer_sales** resource includes assets with sales details.

You might need to assign business terms from the **Sales** glossary to assets in the resource. A glossary defines the organization's agreed definitions for data, activities, business terms, and other objects. A set of well-described business terms allows users from different business functions to link their data and activities to definitions that everyone within the organization can understand.

The following table lists the challenges you might face and the solutions to the challenges:

Challenge	Solution
Make catalog users understand the technical asset names which use the database standards.	You can use well-described business terms from business glossary and Axon glossary to define the technical asset names in the catalog.
Search for the assets and manually assign the business term to each asset.	You can use the Catalog Administrator to edit and configure the **customer_sales** resource to automatically associate business terms from the **Sales** glossary with the assets in the resource.
The data steward might not have access to the run profiling or column similarity options to enable intelligent business term all the time.	You can use the **Enable Business Term Association** section to configure automatic terms association.

Prerequisites

Before you configure the **customer_sales** resource for intelligent business term associations and recommendations, ensure you have met the following prerequisites:

- Create and run the required Business Glossary and Axon resources.
- Upload the synonym definition list in Catalog Administrator if you want Enterprise Data Catalog to use synonyms and stop words during the business term association process, and associate business terms with assets.
  For more information about synonym definitions, see the Manage Synonym Definitions chapter in the Catalog Administrator guide.

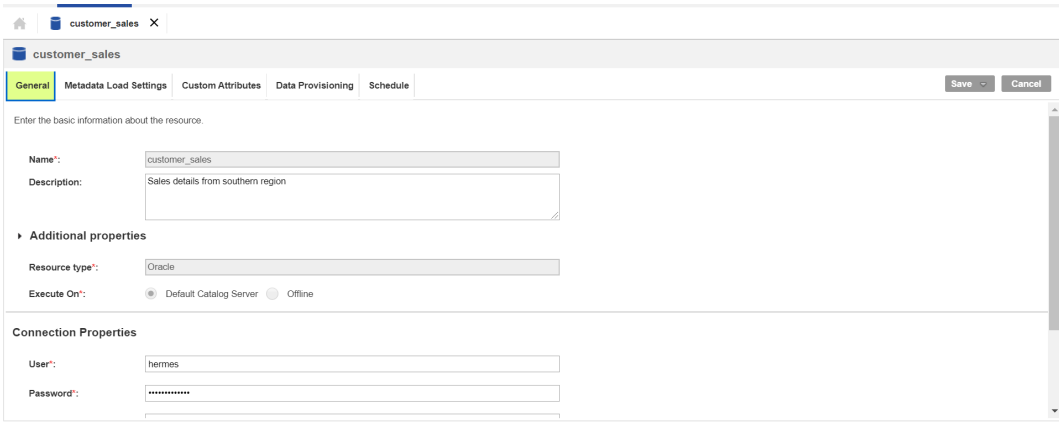

Lesson 1: Configure a Resource to Automatically Associate Business Terms with Assets

You can configure the **Business Term Association settings** for a resource to automatically associate or recommend the business terms as a business title for assets in the catalog.

In this lesson, we will edit and configure the **customer_sales** resource to automatically associate business terms with the assets.

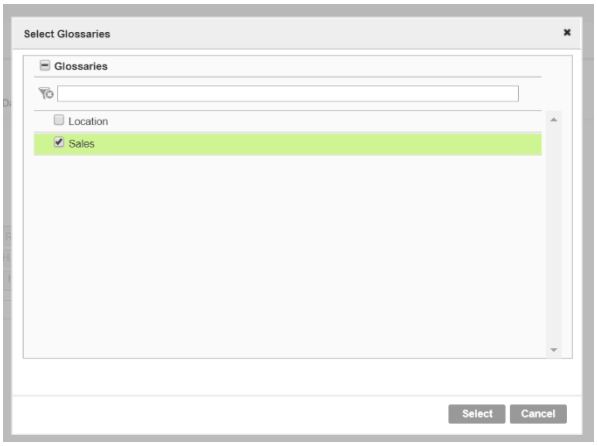

Perform the following steps to configure the resource to automatically associate the business term:

1. Open the **customer_sales** resource in the edit mode as shown in the following image:

2. Click **Metadata Load Settings** to move to the **Metadata Load Settings** page.
3. On the **Metadata Load Settings** page, configure the following properties in the **Business Term Association** section:
   a. **Enable Business Term Association**. Select this option to configure the settings.
   b. **Glossaries**. Click **Select**.

      The **Select Glossaries** window appears as shown in the following image:

   c. Select the **Sales** glossary from the **Select Glossaries** window.
   d. **Use synonyms and stop words**: Select this option to use synonyms and stop words during the intelligent business term association process.

      Some examples of stop words include 'the', 'a', 'an', and 'in'.
   e. **Ignore Prefixes**: Enter `Re, pre, after .`

      Use this option if you want to avoid prefixes in the asset name during the intelligent business term association process. You can enter a comma separated list of prefixes.

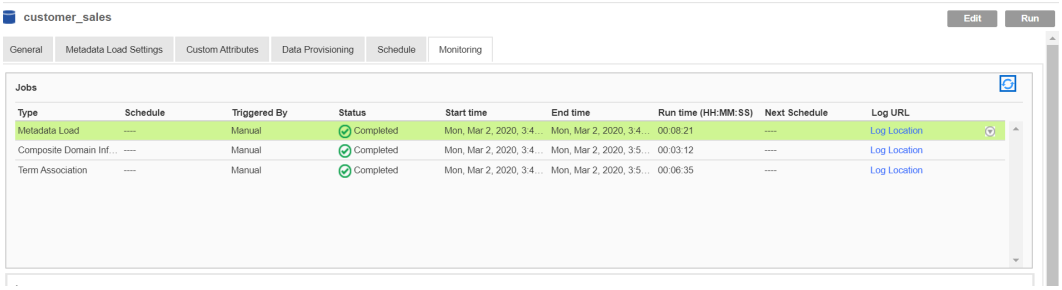

f. **JVM options**: Configure the feature weight and thresholds for the resource.

Use the feature weight jvm options to customize the priority of the data domains, column similarity, and name match conditions during the business term association process.

Use the threshold jvm options to customize the threshold limit for automatic business term associations and recommendations. Based on the threshold limit that you set, Enterprise Data Catalog assigns business terms or recommends business terms to assets.

4. Click **Save and Run**.

For more information about the threshold limit, see the Intelligent Business Term Association topic in the Enterprise Data Catalog User Guide.

For more information about the jvm options, see the Enable Business Term Association topic in the Catalog Administrator Guide.

Lesson 2: View Associated Business Terms in the Catalog

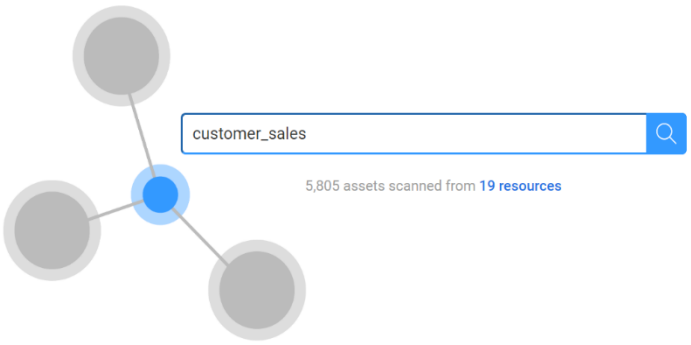

After you configure the **customer_sales** resource to automatically associate business terms with assets, you can view the business term association coverage for a resource in the **Assets in the Resource** section of the resource **Overview** tab.

Perform the following tasks to view the associated business terms:

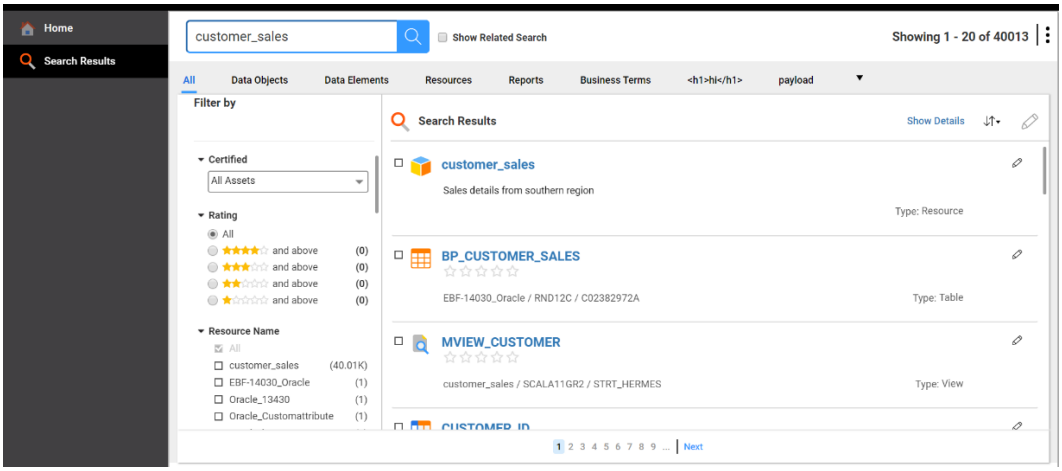

1. Log in to Enterprise Data Catalog.

   The Enterprise Data Catalog search page appears.

2. Type **customer_sales** in the search box and click the search icon.

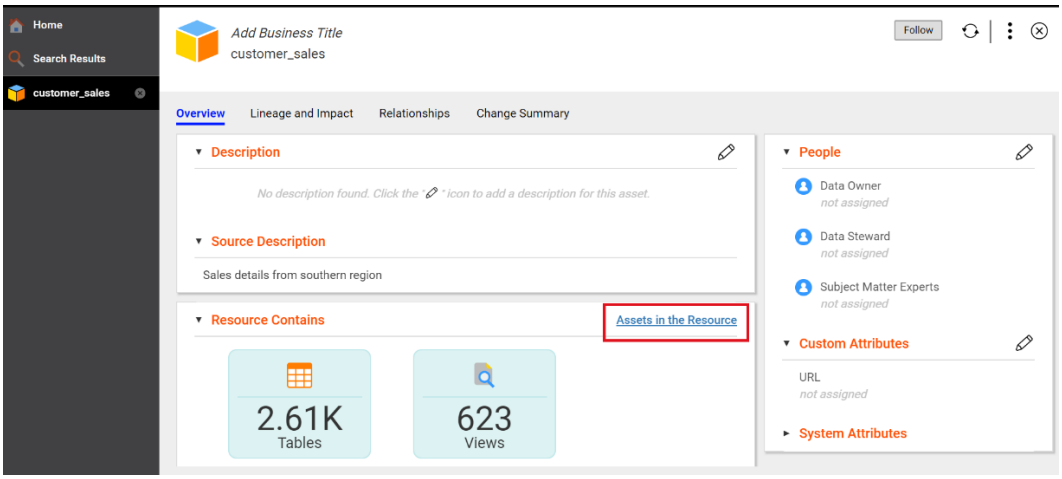

The **customer_sales** resource appears on the **Search Results** page as shown in the following image:

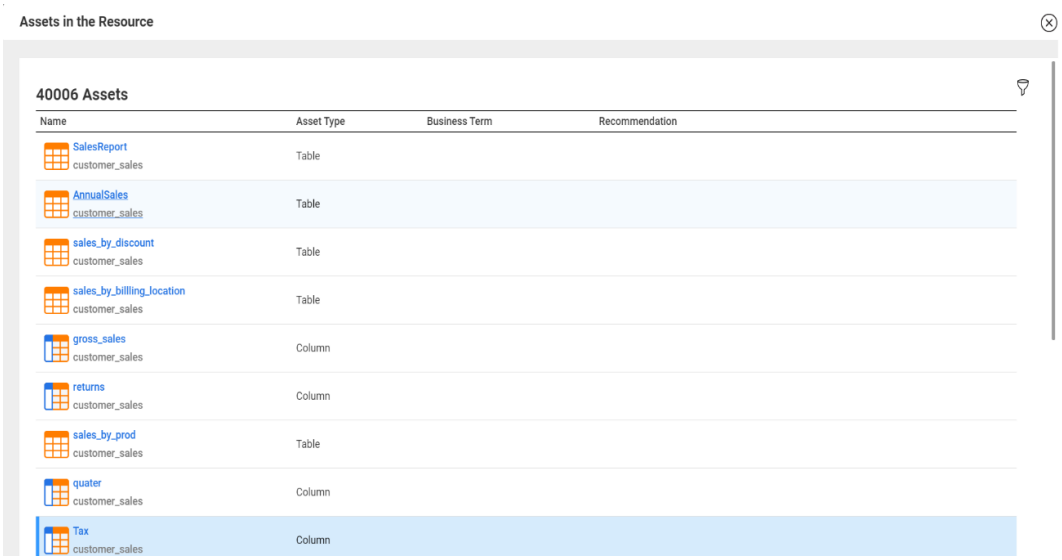

3. From the **Search Results** page, open the **customer_sales** resource.

   The **customer_sales** resource opens in the **Overview** tab.

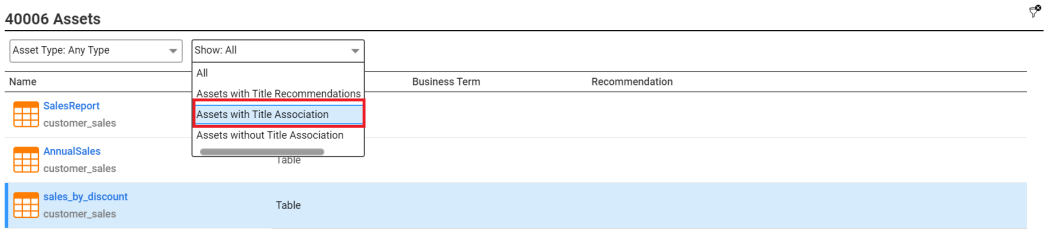

4. In the **Overview** tab of the resource, click the **Assets in the Resource** link as shown in the following image:

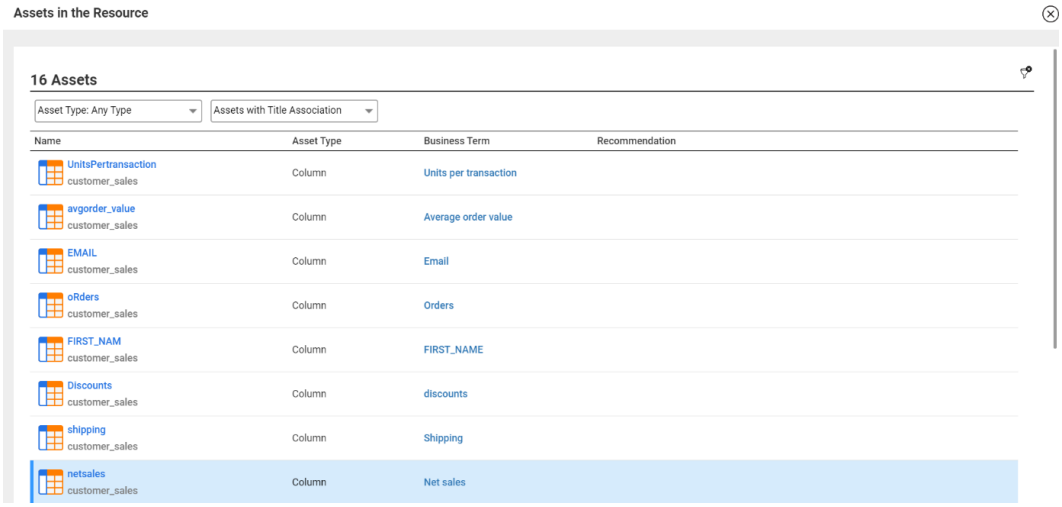

The **Assets in the Resource** window appears as shown in the following image:

5. Click the filter icon and filter the list by **Assets with Title Association** as shown in the following image:

The list of assets in resource with which the business terms are associated appears as shown in the following image:

Frequently Asked Questions

This section lists the frequently asked questions to solve issues related to business term association.

How can I disable business term propagation for a resource?

You can set the **DdisableBGTermPropagation = true** JVM property to disable business term propagation for a resource.

How is the confidence score calculated if catalog contains both Informatica Axon and business glossary terms?

The Axon terms carry an additional weight factor of ten when compared to business glossary term. The Axon terms have a higher confidence score.

Can I change the weight of the features for business term propagation?

Yes, you can modify the weight of the features. However, the changes will apply across the resources that are configured for business term propagation.

How can I modify the weight?

You can add the following JVM options to the Data Domain Propagation resource:

- -Dglossary.propagation.domain.curation.feature.weight=3
- -Dglossary.propagation.column.similarity.feature.weight=1
- -Dglossary.propagation.sequence.alignment.feature.weight=2

How can I make business term propagation depend on data domains, and also have business terms inferred on similar columns?

To enable business term propagation that depend on the accepted data domains to infer business terms on similar columns, you can modify the following JVM options and set the values:

- -Dglossary.propagation.domain.curation.feature.weight=1
- -Dglossary.propagation.column.similarity.feature.weight=0
- -Dglossary.propagation.sequence.alignment.feature.weight=0
