Abstract

This article provides standardized naming conventions for repository objects. Naming conventions improve readability for anyone reviewing or carrying out maintenance on repository objects. The application and enforcement of naming standards establishes consistency in the repository and creates a developer-friendly environment. In addition, the names of artifacts can convey relevant information for tracking and management purposes.

Supported Versions

- Informatica Data Quality 10.1
- Informatica Data Services 10.1
- Informatica Big Data Management 10.1
- Informatica Data Transformation 10.1

Overview

Choosing and adhering to common naming convention is important. When you use consistent names and descriptions, it is easier to understand the workings of mappings and transformation objects. When you provide a name or description, a developer does not have to spend time going through an object or mapping to understand its objective. This article provides suggested naming conventions for transformation types, object types, and workflow objects.

Transformation Naming Conventions

The following table contains standardized naming conventions for transformation types:

Transformation Type	Suggested Naming Convention
Association	AST_<transformation name>
Address Validator	AGG_<transformation name>
Aggregator	AGG_<transformation name>
Association	AST_<transformation name>
Bad Record Exception	EXC_<transformation name>
Case Converter	CCO_<transformation name>
Classifier	CLA_<transformation name>
Comparison	CMP_<transformation name>

Transformation Type	Suggested Naming Convention
Consolidation	CNS_<transformation name>
Data Masking	DMK_<transformation name>
Data Processor	DPR_<transformation name>
Decision	DEC_<transformation name>
Duplicate Record Exception	EXC_<transformation name>
Expression	EXP_<transformation name>
Filter	FIL_<transformation name>
Java	JTX_<transformation name>
Joiner	JNR_<transformation name>
Key Generator	KGN_<transformation name>
Labeler	LAB_<transformation name>
Lookup	LKP_<transformation name>
Match	MAT_<transformation name>
Merge	MRG_<transformation name>
Normalizer	NRM_<transformation name>
Parser	PRS_<transformation name>
Rank	RNK_<transformation name>
Read	SRC_<transformation name>
REST Provider	RESTP_<transformation name>
REST Web Service Consumer	RESTWS_<transformation name>
Router	RTR_<transformation name>
Sequence Generator	SEQ_<transformation name>
Sorter	SRT_<transformation name>
SQL	SQL_<transformation name>
Standardizer	STD_<transformation name>
Union	UN_<transformation name>
Update Strategy	UPD_<transformation name>

Transformation Type	Suggested Naming Convention
Web Service Consumer	WSC_<transformation name>
Weighted Average	WAV_<transformation name>
Write	WRT_<update type>_<target name>

Object Type Naming Conventions

The following table contains standardized naming conventions for repository objects:

Developer Tool Object	Suggested Naming Convention
Application	APP_<application name>
Customized data object	CDO_<data object name>
Logical data object	LDO_<data object name>
Logical data object model	LDOM_<model name>
Mapping	M_<process>_<source system>_<target name>
Mapplet	MPLT_<mapplet name>
Physical data object	PDO_<data object name>
Profile	PRFL_<profile name>
Rule	Rule_<rule name>
Scorecard	SCD_<scorecard name>
SQL data service	SDS_<data service name>
Target	T_<target name>
Virtual schema	VS_<schema name>
Virtual stored procedure	VSP_<procedure name>
Virtual table	VT_<table name>
Web service	WS_<web service name>

Workflow Object Naming Conventions

A workflow object is an event, task, or gateway. The following table contains standardized naming conventions for workflow objects:

Workflow Object	Suggested Naming Convention
Assignment task	AST_<description>
Command task	CMT_<description>
Exclusive gateway task	EXG_<description>
Human task	HT_<exception table name>_<description>
Mapping task	MT_<description>
Notification task	NTF_<description>
Workflow	WF_<workflow name>
