Preface

Follow the instructions in *MDM Extension for Google BigQuery* to deploy the MDM Extension for Google BigQuery.

Informatica Resources

Informatica provides you with a range of product resources through the Informatica Network and other online portals. Use the resources to get the most from your Informatica products and solutions and to learn from other Informatica users and subject matter experts.

Informatica Documentation

Use the Informatica Documentation Portal to explore an extensive library of documentation for current and recent product releases. To explore the Documentation Portal, visit https://docs.informatica.com.

If you have questions, comments, or ideas about the product documentation, contact the Informatica Documentation team at infa_documentation@informatica.com.

IDMC web site

You can access the Informatica® Intelligent Data Management Cloud™ (IDMC) web site at http://www.informatica.com/cloud.

Intelligent Data Management Cloud Communities

Use the IDMC Community to discuss and resolve technical issues. You can also find technical tips, documentation updates, and answers to frequently asked questions.

To access the IDMC Community, see Master Data Management SaaS Community.

Developers can learn more and share tips at the Cloud Developer community:

https://network.informatica.com/community/informatica-network/products/cloud-integration/cloud-developers

IDMC Marketplace

Visit the Informatica Marketplace to try and buy Data Integration Connectors, templates, and mapplets:

https://marketplace.informatica.com/

Informatica Knowledge Base

Use the Informatica Knowledge Base to find product resources such as how-to articles, best practices, video tutorials, and answers to frequently asked questions.

To search the Knowledge Base, visit https://search.informatica.com. If you have questions, comments, or ideas about the Knowledge Base, contact the Informatica Knowledge Base team at KB_Feedback@informatica.com.

IDMC Trust Center

The IDMC Trust Center provides information about Informatica security policies and real-time system availability.

You can access the trust center at https://www.informatica.com/trust-center.html.

Subscribe to the IDMC Trust Center to receive upgrade, maintenance, and incident notifications. The Informatica Intelligent Data Management Cloud Status page displays the production status of all the Informatica cloud products. All maintenance updates are posted to this page, and during an outage, it will have the most current information. To ensure you are notified of updates and outages, you can subscribe to receive updates for a single component or all IDMC components. Subscribing to all components is the best way to be certain you never miss an update.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the IDMC Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.

CHAPTER 1

Introducing MDM Extension for Google BigQuery

An MDM SaaS extension is a ready-to-use package that streamlines and accelerates the implementation of MDM SaaS. MDM SaaS extensions contain pre-configured assets and integrations that extend and enhance the MDM SaaS business applications. Use an extension to reduce implementation time, enhance data quality, and achieve faster business outcomes.

Use MDM Extension for Google BigQuery to publish master data from MDM SaaS to Google BigQuery for analytics and Generative AI applications across industries, such as retail, financial services, and healthcare. The extension provides a Google BigQuery staging schema to publish master data to the Google BigQuery staging store. You can use predefined Data Integration assets to egress the MDM SaaS master data to the Google BigQuery staging store.

The extension provides a sample Google BigQuery analytical schema. You can use predefined Data Integration assets to populate data into the Google BigQuery analytical schema.

The extension provides sample Views in Google BigQuery that are logical tables defined using SQL queries. When you run the SQL query in Google Cloud Console, you can use the Views to visualize customer, supplier, location, and product master data in the Google BigQuery analytical schema. Views help to view analytical reports from the Google BigQuery analytical schema and to make data-driven decisions.

Use MDM Extension for Google BigQuery to achieve the following use cases:

Enhance customer analytics and insights

Provide accurate customer segmentation and measures, such as loyalty and lifetime value, for personalized customer experience and improved customer satisfaction.

Improve supply chain agility and omnichannel commerce

Improve the visibility of a supplier network, spending, performance, risk and ratings. You can streamline the management of large and dynamic product portfolios.

Explore actionable insights into the ESG risk of a supply chain

Calculate supply chain emissions and identify suppliers with the highest impact. You can report scope 1, 2, and 3 emissions, and reduce supply chain risk.

Optimize product experiences

Streamline complex and redundant product data sets for a trusted view of product data.

Guidelines for importing assets

Consider the following guidelines before you import the extension assets:

- Set up the prerequisite MDM SaaS business application.
- Import the extension assets before you customize the business entities. You can safely import multiple extension assets that use different business entities and in different MDM SaaS business applications. When you import the assets in an environment that already has an extension with the same business entities, the import fails.
- After you import the assets, consider them as your custom assets.
- Once you deploy an extension, upgrading to a newer version of the extension isn't supported.

Guidelines for migrating assets

Consider the following guidelines before you migrate the extension assets to another environment:

- To migrate the extension assets to higher environments, such as QA and production, export the assets from the development environment. Then, import them into the QA and production environments. For more information about migrating assets, see *Migrating projects and assets*.
- Don't import the extension assets again into a higher environment.

Prerequisites

Before you deploy the industry 360 application, perform the following prerequisites:

- Ensure that you have the license for the Integration Components for Business 360, MDM SaaS edition, and Google BigQuery V2 Connector.
- Ensure that you have the licenses required to manage connections, external data, and service rights.

  Note: The use of the industry 360 application doesn't confer any additional license or entitlement to license consumption beyond the terms specified in the applicable licensing agreements.
- Ensure that the version of the industry 360 application package matches the current MDM SaaS version where you import the industry 360 application assets.

  If the version of the industry 360 application package doesn't match the current MDM SaaS version, contact Informatica Global Customer Support to use the current version of the industry 360 application.

  To verify the MDM SaaS version, in Business 360 Console, click **About** in the IDMC Help menu and verify the build version.

  To verify the version of the industry 360 application, navigate to the readme.txt file in the extracted industry 360 application package.

CHAPTER 2

MDM SaaS and Google BigQuery integration

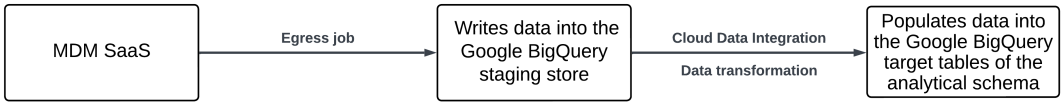

Use MDM Extension for Google BigQuery to integrate MDM SaaS with Google BigQuery to drive analytics and Generative AI applications for customer, location, supplier, and product master data.

Publish master data from MDM SaaS to the Google BigQuery staging store. The extension then publishes data from the staging store into the Google BigQuery target dimension tables.

Data flow to publish master data to Google BigQuery

Use egress jobs and Cloud Data Integration assets to publish master data from MDM SaaS to Google BigQuery staging store. The extension then uses data transformation and taskflows to populate data into the Google BigQuery dimension and fact tables.

The following image shows the flow of data from MDM SaaS to Google BigQuery:

When you run MDM SaaS egress jobs for the MDM SaaS domain, Cloud Data Integration assets export MDM SaaS master data, such as customer, product, location, and supplier master data, into Google BigQuery staging store.

When you run Cloud Data Integration taskflows, Cloud Data Integration transforms and publishes master data from the Google BigQuery staging store into Google BigQuery dimension and fact tables.

Based on your MDM SaaS domain, the master data is placed in the Google BigQuery dimension and fact tables.

You can use the sample Views to view analytical reports from the Google BigQuery analytical schema.

MDM SaaS master data

Based on your MDM SaaS domain, MDM Extension for Google BigQuery uses its corresponding data model.

The following table lists the MDM SaaS domains and their corresponding data model details:

MDM SaaS Domain	Data Model Reference
Customer	*Customer 360 SaaS data dictionary*
Location	*Location 360 data dictionary*
Product	*Product 360 SaaS data dictionary*
Supplier	*Supplier 360 Extension for ESG data dictionary*

Staging schema

The extension writes master data from MDM SaaS to the Google BigQuery staging store.

Based on your MDM SaaS domain, the master data is generated in the tables of the following datasets in the staging store:

- informatica_customer_master_stg
- informatica_item_category_hierarchy_stg
- informatica_item_category_relationship_stg
- informatica_location_master_stg
- informatica_product_master_stg
- informatica_supplier_master_stg

Analytical schema

The analytical schema is a repository for master and transactional data in Google BigQuery. Use the analytical schema to gain insights into the data.

When you run Cloud Data Integration taskflows, the Cloud Data Integration assets transform and publish master data from the Google BigQuery staging store into Google BigQuery dimension and fact tables.

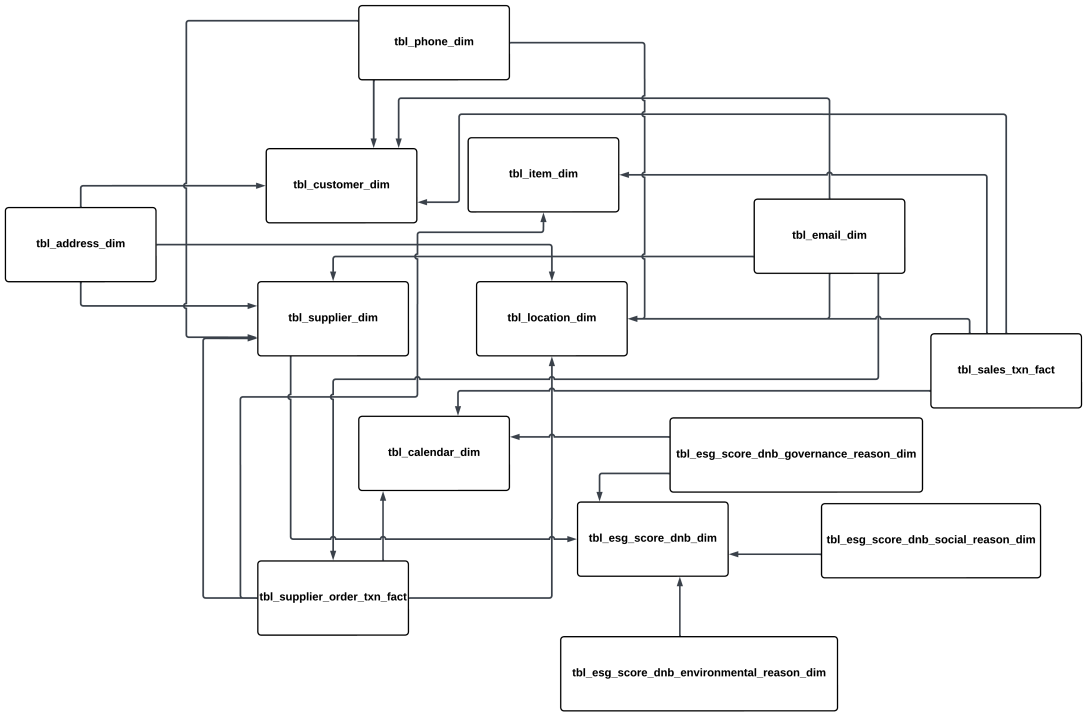

The analytical schema includes the following dimension and fact tables.

- tbl_address_dim
- tbl_calendar_dim
- tbl_customer_dim
- tbl_email_dim
- tbl_esg_score_dnb_dim

- tbl_esg_score_dnb_environmental_reason_dim
- tbl_esg_score_dnb_governance_reason_dim
- tbl_esg_score_dnb_social_reason_dim
- tbl_item_dim
- tbl_location_dim
- tbl_phone_dim
- tbl_supplier_dim
- tbl_sales_txn_fact
- tbl_supplier_order_txn_fact

Based on your use case, you can create or edit the target dimension and fact tables.

The following image shows the tables of the Google BigQuery analytical schema and their relationships:

CHAPTER 3

MDM Extension for Google BigQuery assets

MDM Extension for Google BigQuery is available for installation on request.

The extension package includes the following predefined assets:

- Data definition language (DDL) scripts to create Google BigQuery staging schema, Google BigQuery analytical schema, and sample Views.
- Cloud Data Integration assets
- MDM SaaS batch jobs
- Secure Agent group parameter files

Note: When you import the MDM Extension for Google BigQuery assets, the existing MDM SaaS assets and your customizations are overwritten. Ensure that you import the assets of the extension before you customize the MDM SaaS data model.

Data Definition Language (DDL) scripts

Use DDL scripts to create Google BigQuery staging schema, Google BigQuery analytical schema, and sample Views.

You can use the scripts to create the Google BigQuery staging schema for MDM SaaS customer, supplier, product, and location master data. You can also use the scripts to create enhanced analytical schema for Store, Customer, and Supplier analytics.

MDM Extension for Google BigQuery also includes sample Views. Views are logical tables defined using SQL queries. When you run the SQL query in Google Cloud Console, you can use the Views to visualize data in the Google BigQuery analytical schema.

Cloud Data Integration assets

MDM Extension for Google BigQuery includes Cloud Data Integration assets, such as mappings, mapping tasks, and taskflows, to write data from MDM SaaS to the Google BigQuery staging store. You can also use the Cloud Data Integration taskflows to publish data from the Google BigQuery staging store to Google BigQuery analytical dimension and fact tables.

The extension includes batch jobs to egress data from MDM SaaS to the Google BigQuery staging schema.

CHAPTER 4

Deploying MDM Extension for Google BigQuery

Before you deploy MDM Extension for Google BigQuery, ensure that you have the license for the Integration Components for Business 360 and the MDM SaaS edition.

To deploy MDM Extension for Google BigQuery, perform the following tasks:

1. Download and extract the extension package.
2. Create datasets.
3. Import the DDL scripts to generate Google BigQuery staging and analytical schema.
4. Import Cloud Data Integration assets.
5. Import the MDM SaaS batch jobs.
6. Set the Secure Agent parameters.

Note: To import the master data model, ensure that you belong to the MDM Designer and Designer user roles. Ensure that you don't have the Admin user role.

Extracting the MDM Extension for Google BigQuery package

Download the MDM Extension for Google BigQuery package from the download site to a directory on your machine.

To get the link to the download site, contact Informatica Global Customer Support.

After you download the MDM Extension for Google BigQuery package, extract the package on your machine.

The extracted package contains the following files and folders:

File or Folder Name	Description
1_BigQuery_Staging	Folder that contains the BigQuery_Staging.zip file. The BigQuery_Staging.zip file contains scripts to create the Google BigQuery staging store.
2_BigQuery_Analytics	Folder that contains the BigQuery_Analytics.zip file. The BigQuery_Staging.zip file contains scripts to create the Google BigQuery analytical schema.
3_DI_Assets_Staging	Folder that contains the following files: - Customer_Staging.zip. Contains Cloud Data Integration assets to write customer master data to the Google BigQuery staging store. - Product_Staging.zip. Contains Cloud Data Integration assets to write product master data to the Google BigQuery staging store. - Supplier_Staging.zip. Contains Cloud Data Integration assets to write supplier master data to the Google BigQuery staging store. - Location_Staging.zip. Contains Cloud Data Integration assets to write location master data to the Google BigQuery staging store.
4_DI_Assets_Analytics	Folder that contains the DI_Assets_Analytics.zip file. The DI_Assets_Analytics.zip file contains Cloud Data Integration assets to write data from the Google BigQuery staging store to Google BigQuery analytical dimension and fact tables.
5_MDM_Jobs_Assets_Staging	Folder that contains the following files: - Customer_Jobs_Assets_Staging.zip. Contains jobs to egress customer master data to the Google BigQuery staging store. - Product_Jobs_Assets_Staging.zip. Contains jobs to egress product master data to the Google BigQuery staging store. - Supplier_Jobs_Assets_Staging.zip. Contains jobs to egress supplier master data to the Google BigQuery staging store. - Location_Jobs_Assets_Staging.zip. Contains jobs to egress location master data to the Google BigQuery staging store.
Secure Agent Files	Contains parameter values for the Cloud Data Integration mappings.

Creating datasets

After you download and extract the extension package, create datasets to organize dimension tables and views in Google BigQuery.

1. In Google Cloud, click **Console**.
2. From the **Navigation** menu, click **BigQuery**.
3. Select the project where you want to create a dataset.
4. Expand the **Actions** menu, and click **Create dataset**.
5. On the **Create dataset** page, enter the following parameters:
   - Dataset ID. Unique dataset identifier.

- Location type. Geographic location of the dataset.

  Note: Ensure that you use the same geographic location for all datasets.

Running the data definition language (DDL) scripts in Google BigQuery

To add Google BigQuery staging and analytical schema, run the DDL scripts in Google BigQuery.

1. In Google Cloud, click **Console**.
2. From the **Navigation** menu, click **BigQuery**.
3. Select the project from where you want to run the script.
4. Click the **Create SQL query** icon.
5. Copy the script from the extracted extension package to the Query editor text area.
6. Click **Run**.

Importing the Cloud Data Integration assets

Import the Cloud Data Integration assets, such as predefined taskflows, mapping tasks, and mappings for the staging and the analytical schema.

1. In Data Integration, click **Explore** > **Import**.
2. Navigate to the following file:

   `<Extracted extension package>/2_DI_Assets_Staging/<Domain>_Staging.zip`
3. Click **Open**.

   The **Import Assets** page lists the assets in the file.
4. Ensure that all the assets are selected, and then select **Publish Taskflow(s) after import**.
5. Click **Import**.
6. On the **My Import/Export Logs** page, verify whether the import job is successful.
7. Navigate to the following file and repeat steps 3 through 6:

   `<Extracted extension package>/2_DI_Assets_Analytics/<Domain>_Analytics.zip`

Importing the job assets

Import the job assets to egress MDM SaaS master data to Google BigQuery staging store.

1. In Business 360 Console, click **Explore** > **Import**.
2. Navigate to the following file:

   `<Extracted extension package>/3_MDM_Job_Assets_Staging/<Domain>_Job_Assets_Staging.zip`

3. Click **Open**.

   The **Import Assets** page lists the assets in the file.
4. Ensure that all the assets are selected, and click **Import**.
5. On the **My Import/Export Logs** page, verify whether the import job is successful.

Setting up the Secure Agent parameters

After you import the MDM SaaS batch jobs, set the Secure Agent parameters.

1. In Administrator, click **Runtime Environments**.
2. Expand the **Actions** menu for the Secure Agent, and select **Edit Secure Agent**.
3. In the **Custom Configuration Details** section, enter the following details:

Field Name	Value
Type	DTM
Name	SFTP_MaxWriteSize
Value	8192

4. To save the custom configuration of the Secure Agent, click **OK**.

   The Secure Agent restarts automatically within 10 minutes. To apply the properties immediately, you can restart manually. To avoid failure of any running task, ensure that no tasks run .

Importing the parameter file

Import the list of user-defined parameters and their associated values for Cloud Data Integration mappings.

To import the parameter file, save the parameter file in the Secure Agent installation directory.

Copy the parameter file from the source directory to the target Secure Agent installation directory.

Source: `<Extracted extension package>\Secure Agent Files\Parameter Files\Informatica.param`

Target: `<Secure Agent Installation Directory>\apps\Data_Integration_Server\data\userparameters`

Optionally, if you want to use a configured path for the target location, see Parameter file location.

Running the jobs

After you integrate MDM SaaS with Google BigQuery, you can run the egress jobs.
