Preface

Read *Introduction* to learn about the tasks you can perform using IDMC℠ Business 360 Console.

CHAPTER 1

Introducing Informatica Cloud Business 360 Console

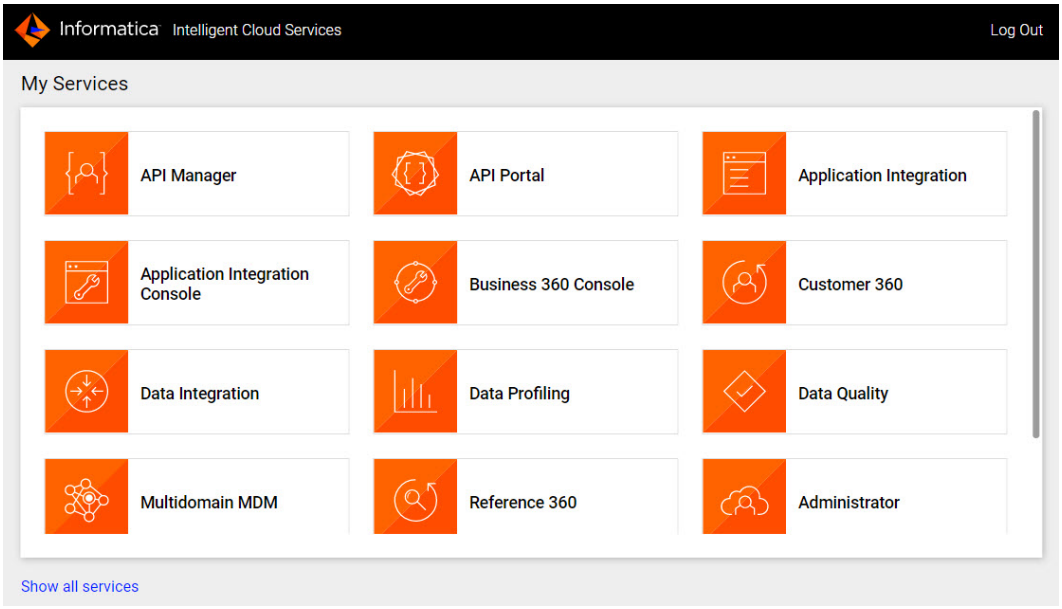

Informatica Cloud® Business 360 Console is one of several services available in IDMC. Business 360 Console is an on-demand subscription service that provides a platform for cloud master data management. Use Business 360 Console to create a variety of master data management projects to fit your business needs.

When you log in to IDMC, the **My Services** page displays the Business 360 Console service and related services that are supported based on your license. The **My Services** page might also include other services that you subscribe to and trial versions of other services.

The following services apply to master data management:

- Business 360 Console. Create and manage data management projects. You can create assets, such as business entities, define relationships between them, define workflows, and design custom business applications. You can also manage service integrations, and run and monitor batch jobs.
- Administrator. Perform administrative tasks, such as creating users and managing privileges, downloading Secure Agents and configuring runtime environments, configuring connections, managing licenses, and creating schedules.
- Data Quality. Create assets to verify, standardize, and improve the quality of your data.
- Data Integration. Create assets such as mappings, tasks, and taskflows to ingress and egress data.

- Application Integration. Define workflows as processes that contain sets of instructions to automate your business requirements.

You might want to use additional services with Business 360 Console, such as Metadata Command Center. You can use Metadata Command Center to scan and extract MDM SaaS metadata, thereby making it available in a data catalog for lineage and glossary associations. For more information about scanning and extracting metadata, see the *Informatica Intelligent Cloud Services* chapter of the *Catalog Source Configuration* module in the *Metadata Command Center* help.

Play the following videos that demonstrate how to use the Business 360 Console:

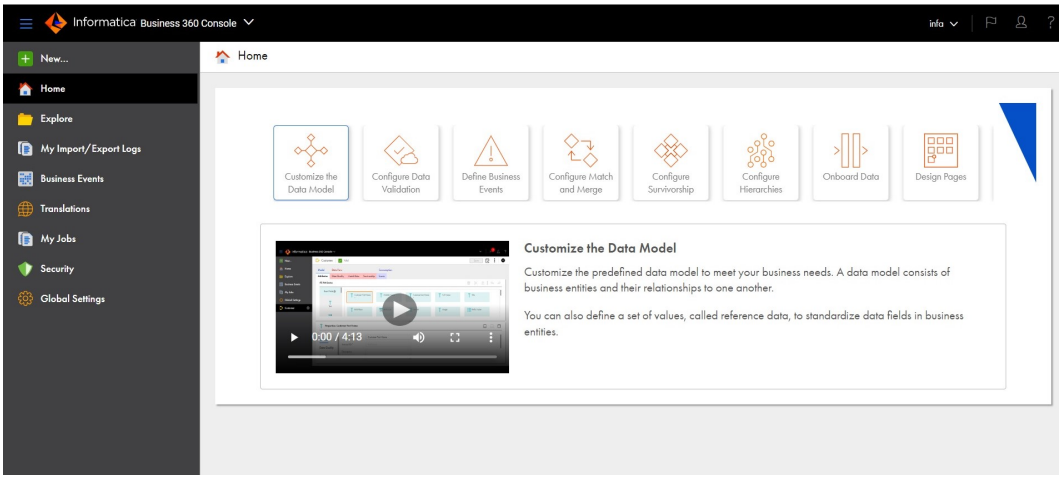

Video	Description
	Define a new data model or customize the predefined ones to meet your business needs. A data model consists of business entities and their relationships to one another. You can also define a set of values, called reference data, to standardize data fields in business entities. Learn more >
	Cleanse and standardize your data by associating data quality rules to business entity fields. Configure data quality rules based on your business requirements to automatically improve the quality the data that you add or import. Learn more >
	Resolve duplicate records in your data by configuring a match model. Tailor the model to suit the characteristics of your data set, such as volume, quality, and type of data. Achieve accurate match results by defining match rules that are part of you match model. Choose match and merge strategies to identify duplicate records and to determine the outcome of the match process. Learn more >
	Select the most accurate data from multiple source records and create master records by configuring survivorship. The survivorship configuration includes source system ranking and survivorship rules. Learn more >

Video	Description
	Ensure changes to data move through a workflow by defining business events that trigger workflows. Your business event configuration includes the user roles, assets, and actions that trigger a workflow. You can also define the workflow, approvers, and default task properties associated to the business event. Learn more >
	Help users visualize relationships between business entities in a hierarchical format. You can create hierarchy models and define hierarchy relationships between business entities. Learn more >
	Onboard data from different sources to master the data. Use the master data to make better business decisions. You can define jobs that periodically import and export data based on your business requirements. Learn more >
	Manage your data with flexibility by designing custom pages for your applications. You can add user interface elements, such as tabs, panels, and sections, to a custom page. Assign the customized page to your application and view the user interface as per your customization. Learn more >

Business 360 Console

Use Business 360 Console to create data management projects and run data integration tasks.

When you select Business 360 Console from the **My Services** page, the Business 360 Console **Home** page appears, as shown in the following image:

You can access the following pages from the navigation bar for Business 360 Console:

- New. Create Business 360 Console assets, such as business entities, workflows, and applications.
- Home. Return to the Home page.
- Explore. Create and manage projects and assets.

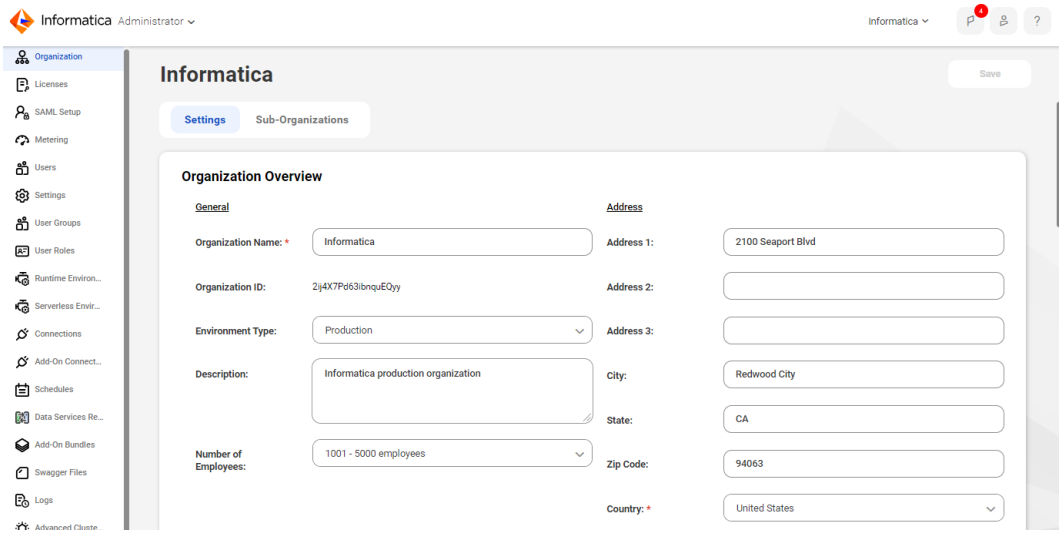

- My Import/Export Logs. View and download the logs of your import and export jobs.
- Business Events. Create business events to trigger workflows.
- Translations. Manage the translations of asset labels that appear in business applications.
- My Jobs. View, schedule, and monitor jobs.
- Security. Configure privileges and data access rules for custom user roles.
- Global Settings. Configure the settings for license keys, Informatica Global Customer Support access, and data purge.

When you switch from Business 360 Console to another service, such as Administrator or Monitor, the options in the navigation bar change to suit the service.

Administrator

Administrative tasks for IDMC are performed in the Administrator service.

When you select Administrator from the **My Services** page, the navigation bar provides options for IDMC administration, as shown in the following image:

The following options are available based on your licenses:

- Organization. Manage your organization details and your sub-organizations.
- Licenses. View licenses for your organization and manage your sub-organization licenses.
- Ecosystem single sign-on. When you create your organization through Microsoft Azure, configure some single sign-on properties for Azure users.
- SAML Setup. Configure SAML single sign-on settings.
- Settings. Upgrade settings for Secure Agent services.
- Users. Add new users. Configure user groups and roles for individual users.
- User Groups. Create user groups. Assign users to user groups.
- User Roles. Manage user roles for your organization. Configure the privileges associated with each role.
- Runtime Environments. Configure Secure Agents and Secure Agent groups.

- Connections. Create and manage connections.
- Add-On Connectors. Install add-on connectors.
- Schedules. Create and manage schedules for tasks.
- Add-On Bundles. Install, uninstall, upgrade, and copy bundles for your organization.
- Swagger Files. Generate swagger files for REST V2 connections.
- Logs. View asset and security logs.
- File servers. Configure file transfer servers and file transfer users to allow remote partners to send files to your organization.

Security

IDMC uses authentication and encryption to ensure that data is secure and available only to users within the organization. IDMC uses industry approved algorithms to encrypt sensitive information.

All sensitive customer data is encrypted at rest using an AES-256 key. All customer data in transit is encrypted using either the TLS 1.2 or TLS 1.3 protocol depending on which ciphers are used in the customer's environment. TLS 1.3 offers several improvements over TLS 1.2 including improved performance and simpler, more secure cipher suites.

For more information about security in IDMC, see the Informatica Intelligent Data Management Cloud Trust Center. For more information about supported ciphers, see the Change in Cipher Suites for IDMC Knowledge article.

CHAPTER 2

Key concepts

Before you get started with Business 360 Console, become familiar with some key concepts.

Master data and Master Data Management

Master Data Management is the process by which master data is created and maintained as the system of records for an organization. Master data is data that is validated as correct, consistent, complete, and is the most up-to-date and accurate data.

Master data is created by consolidating the most trustworthy data from various source systems containing duplicate and conflicting data into Business 360 Console, resulting in master records that reflect the best version of the truth.

Business entity

A business entity is an entity of importance to your organization. Business entities can be people, places, or things. You can use the predefined business entities or create a new business entity. You can also customize the business entities by adding or removing fields and by editing other attributes, such as data quality and survivorship rules.

Reference data

Reference data is a set of values and codes that appear in a business entity picklist field. Use reference data to standardize values, such as country codes, currency codes, product codes, and cost centers.

For example, a Country reference data can contain a complete list of countries in the world. If you need a Country field in a business entity, add a Country picklist field and link it to the Country reference data.

Reference data can be dependent on other reference data. Use dependent reference data to provide context for values that are not unique, such as the names of cities. For example, to uniquely identify a city, you need the state and country of the city. Also, you can use dependent reference data to narrow down a large set of values. For example, when the City reference data is dependent on the Country and State reference data, only the cities within the selected state of a country are listed.

Data model

A data model is a definition of how data is structured. A data model includes business entities, reference data, relationships between business entities, and hierarchies.

Business entities are the core component of a data model.

MDM SaaS relies on a document-type data model instead of a relational data model.

Authorization asset

Authorization asset is an internal asset that an administrator uses to export and import the user roles and their associated privileges from a source organization to a target organization.

Organization

An organization is a secure area within the IDMC repository that stores your licenses, user accounts, Business 360 Console assets, such as business entities and relationships, and information about jobs and security. MDM SaaS doesn't support sub-organizations, so you can't use any business application in a sub-organization.

Note: An IDMC user configured with the Admin role has full access to all the licensed services of the organization. This user can manage the organization and perform administrative tasks, such as configuring runtime environments, configuring the organization profile, and managing the organization security.

Match

Match is the process of comparing records based on a set of predefined criteria or rules to identify duplicate records. Duplicate records are identical or similar to the records against which they are matched. Based on your configuration, the duplicate records identified by the match process are either automatically merged or queued for manual merge by a data steward.

Data store

The data store is the database for MDM SaaS to store master records, source records, relationship records, hierarchies, and history data.

Industry 360 applications

An industry 360 application is a ready-to-use package that you can use as a template to get started with MDM SaaS. With industry 360 applications, you can customize solutions to meet requirements and business initiatives that are specific to industries, such as healthcare, life sciences, and insurance.

An industry 360 application is available as a package for installation on request. The package can include predefined Intelligent Data Management Cloud (IDMC) assets, such as predefined business entities, relationships, pages, search result layout components, reference data, and Cloud Data Integration and Cloud Application Integration assets.

For more information about industry 360 applications, see *Introducing industry 360 applications*.

MDM SaaS extensions

An MDM SaaS extension is a ready-to-use package that streamlines and accelerates the implementation of MDM SaaS. MDM SaaS extensions contain pre-configured assets and integrations that extend and enhance the existing MDM SaaS business applications. You can customize the assets based on your requirements. For example, you can use Customer 360 Extension for Salesforce to integrate Salesforce with Customer 360 SaaS and process the Salesforce records in Customer 360 SaaS.

An extension is available as a package for installation on request. The package can include predefined Intelligent Data Management Cloud (IDMC) assets, such as business entities, relationships, pages, search result layout components, reports, reference data, and Cloud Data Integration and Cloud Application Integration assets.

For more information about MDM SaaS extensions, see *Introducing MDM SaaS extensions*.

CHAPTER 3

Business 360 Console tools

IDMC provides the following tools that you can use to satisfy your master data management business needs:

- "Projects" on page 12
- "Assets" on page 13
- "Explore page" on page 13

Projects

IDMC assets are organized into projects. You can create multiple folders within a project to contain the assets that you need for your project.

Based on your license, the Explore page displays the projects applicable to you.

You can copy, move, or delete any custom project or asset. You can't add, update, or delete any asset in the predefined projects. You can't copy or move predefined MDM SaaS assets, such as pages, components, or job definitions.

The types of assets that you use in your projects depend on the services that you use. For example, the Business 360 Console project includes assets, such as source systems, rule specifications, and business applications.

The following table describes the predefined MDM SaaS projects:

Project	Description
Business360	Contains predefined assets that all business applications can use. You can create folders within this project and add custom assets to them.
Customer360	Contains predefined assets specific to MDM - Customer 360 SaaS. You can see this project only if you have the Customer 360 license. You can create folders within this project and add custom assets to them.
Default	Contains custom assets. If you create an asset without selecting a specific project, the asset is created in this project.
MultidomainMDM	Contains predefined assets specific to Multidomain MDM SaaS. You can see this project only if you have the Multidomain MDM license. You can create folders within this project and add custom assets to them.

Project	Description
Reference360	Contains predefined reference data assets that you can use in any business application. You can create folders within this project and add custom reference data assets to them.
Product360	Contains predefined assets specific to MDM - Product 360 SaaS. You can see this project only if you have the Product 360 license. You can create folders within this project and add custom assets to them.
Supplier360	Contains predefined assets specific to MDM - Supplier 360 SaaS. You can see this project only if you have the Supplier 360 license. You can create folders within this project and add custom assets to them.

Assets

In Business 360 Console, the core assets are business entities, source systems, business applications, pages, and components. You can create rule specification assets in Data Quality for operations such as data standardization, data cleansing, and data validation. Also, you can create process assets in Application Integration to automate business processes such as file import, task triggers, and match and merge.

Additionally, Business 360 Console includes predefined assets, such as business entities, user interface components, and pages, to help you get started with using business applications.

You can't move, copy, or delete any asset.

Create the assets you need to satisfy your business needs. You can use the assets in multiple projects. All assets must be part of at least one project. If you create an asset without specifying a project, the asset is created in the Default project.

Explore page

Use the **Explore** page to work with your IDMC projects and assets.

Finding projects and assets on the Explore page

Use any of the following methods to find your projects and assets on the **Explore** page:

- Explore by projects and folders. View all projects or select a particular project.
- Explore by asset types. View all assets or view assets of a particular type.
- Explore by tags. View assets associated with a particular tag.
- Search for projects or assets. To search all projects, folders, and assets in the organization, view the **Explore** page by **All Projects**, and then enter a name or description in the Find box. Or, to narrow your search, view the **Explore** page by **Asset Types** and select an asset type from the **All Assets** list. Then, in the Find box, enter a name or description in full or part.

- Sort the search results. Sort the **Explore** page by name, asset type, last update date, create date, description, or status. When you sort by type, the **Explore** page groups assets by asset type. It does not list the asset types in alphabetical order.
- Filter the objects on the page. To filter objects, click the **Filter** icon. To apply a filter, click **Add Field**, select the property to filter by, and then enter the property value. The filters available depend on how you view the page. You can specify multiple filters.

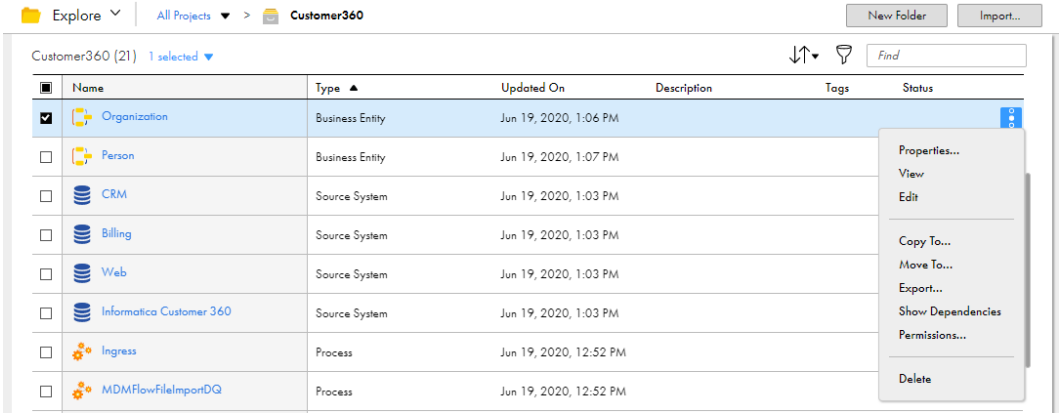

You can see projects, folders, and assets for all of the services that you use. If you select an asset to open it or perform an action, and the asset is created in a different service than the one you have open, the service opens in a new browser tab.

You can't use the following characters:

```
# ? ' | { } " ^ & [ ] / \
```

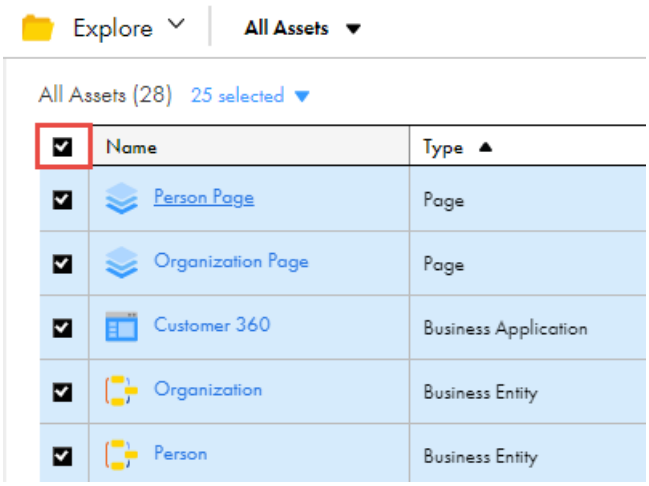

Working with projects and assets on the Explore page

Perform actions on projects, folders, and assets on the **Explore** page. To see what actions you can perform on an object, in the row that contains the object, click the **Actions** icon, as shown in the following image:

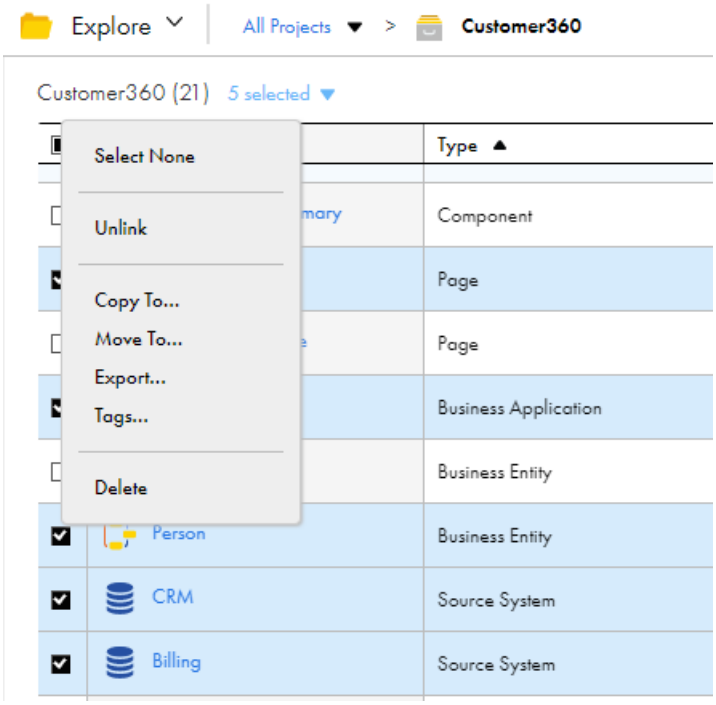

The Actions menu lists the actions you can perform based on your user role privileges and the permissions specified for the selected object. For example, your user role might have privileges to view and edit business entities but not to delete business entities. You might not have permission to edit a particular business entity because of the permissions set by the creator of the business entity.

You can also perform an action on multiple objects at one time. Select the check box to the left of each object, or select the Select All check box to select all of the objects that are displayed on the current page. The following image shows the Select All check box in use:

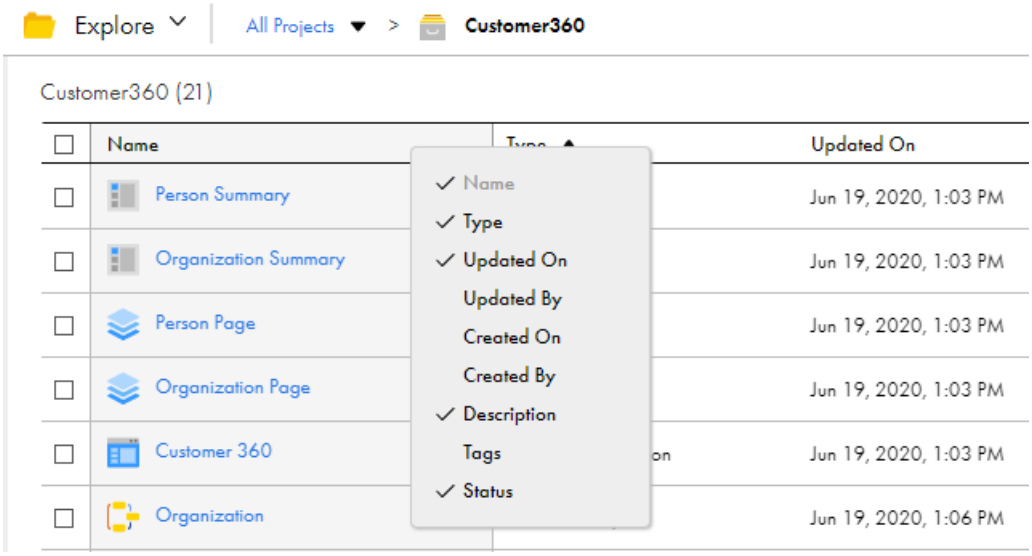

After you select the objects, click **Actions** in the row of any of the selected objects. The Actions menu will list the actions available for the selected assets based on your user role and privileges.

Alternatively, you can use the Selection menu to choose the action, as shown in the following image:

Customizing the Explore page

You can display, hide, or rearrange object properties on the **Explore** page. To display or hide properties, right-click the column heading area and check or uncheck the properties. The following image shows the properties menu on the **Explore** page column heading area:

To rearrange columns, click a column heading and drag it to a different location.

CHAPTER 4

Informatica Resources

Informatica provides you with a range of product resources through the Informatica Network and other online portals. Use the resources to get the most from your Informatica products and solutions and to learn from other Informatica users and subject matter experts.

Informatica Documentation

Use the Informatica Documentation Portal to explore an extensive library of documentation for current and recent product releases. To explore the Documentation Portal, visit https://docs.informatica.com.

If you have questions, comments, or ideas about the product documentation, contact the Informatica Documentation team at infa_documentation@informatica.com.

IDMC web site

You can access the Informatica® Intelligent Data Management Cloud™ (IDMC) web site at http://www.informatica.com/cloud.

Intelligent Data Management Cloud Communities

Use the IDMC Community to discuss and resolve technical issues. You can also find technical tips, documentation updates, and answers to frequently asked questions.

To access the IDMC Community, see Master Data Management SaaS Community.

Developers can learn more and share tips at the Cloud Developer community:

https://network.informatica.com/community/informatica-network/products/cloud-integration/cloud-developers

IDMC Marketplace

Visit the Informatica Marketplace to try and buy Data Integration Connectors, templates, and mapplets:

https://marketplace.informatica.com/

Informatica Knowledge Base

Use the Informatica Knowledge Base to find product resources such as how-to articles, best practices, video tutorials, and answers to frequently asked questions.

To search the Knowledge Base, visit https://search.informatica.com. If you have questions, comments, or ideas about the Knowledge Base, contact the Informatica Knowledge Base team at KB_Feedback@informatica.com.

IDMC Trust Center

The IDMC Trust Center provides information about Informatica security, compliance, and privacy practices.

You can access the trust center at https://trust.informatica.com/.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the IDMC Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.
