Preface

Follow the instructions in *Manage Localization* to translate business applications into the available language of your preference. Learn how to manage translations for your business applications.

Informatica Resources

Informatica provides you with a range of product resources through the Informatica Network and other online portals. Use the resources to get the most from your Informatica products and solutions and to learn from other Informatica users and subject matter experts.

Informatica Documentation

Use the Informatica Documentation Portal to explore an extensive library of documentation for current and recent product releases. To explore the Documentation Portal, visit https://docs.informatica.com.

If you have questions, comments, or ideas about the product documentation, contact the Informatica Documentation team at infa_documentation@informatica.com.

IDMC web site

You can access the Informatica® Intelligent Data Management Cloud™ (IDMC) web site at http://www.informatica.com/cloud.

Intelligent Data Management Cloud Communities

Use the IDMC Community to discuss and resolve technical issues. You can also find technical tips, documentation updates, and answers to frequently asked questions.

To access the IDMC Community, see Master Data Management SaaS Community.

Developers can learn more and share tips at the Cloud Developer community:

https://network.informatica.com/community/informatica-network/products/cloud-integration/cloud-developers

IDMC Marketplace

Visit the Informatica Marketplace to try and buy Data Integration Connectors, templates, and mapplets:

https://marketplace.informatica.com/

Informatica Knowledge Base

Use the Informatica Knowledge Base to find product resources such as how-to articles, best practices, video tutorials, and answers to frequently asked questions.

To search the Knowledge Base, visit https://search.informatica.com. If you have questions, comments, or ideas about the Knowledge Base, contact the Informatica Knowledge Base team at KB_Feedback@informatica.com.

IDMC Trust Center

The IDMC Trust Center provides information about Informatica security, compliance, and privacy practices.

You can access the trust center at https://trust.informatica.com/.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the IDMC Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.

CHAPTER 1

Introduction to localization

You can use your business applications in different languages. To use the application in languages other than English, translate the labels of assets associated with your applications into those languages.

To translate asset labels, you get started with the translation files that contain translations for all the predefined asset labels. You can also specify the languages that users can use to search for records in business applications.

Before you translate your business applications or configure searchable languages, ensure that you define your data model, and complete configuring business applications.

To manage localization, you need one of the following user roles:

- Admin
- Designer
- MDM Designer

When you add or customize assets in your business applications, you need to update the translation files with translations for the new and custom asset labels. For example, you might configure custom data models and add custom pages, components, and other configurations to your business applications. After you add these custom assets, translate the labels of these assets in the translation files.

Translation languages

Determine the languages to which you want to translate the labels of assets associated with your business applications.

You can translate asset labels to the following languages:

- French
- German
- Japanese
- Portuguese
- Spanish

Searchable languages

Determine the languages that you want to use to search for records in your business applications.

You can search for records in the following languages:

- English
- Japanese

CHAPTER 2

Translation files

Translation files are the source files that you can use to translate your business applications. Informatica provides translation files that contain translations for the labels of predefined assets. The translation files are in the JSON format. You can use these source files to translate asset labels that appear in your business applications.

The translation files contain key-value pairs for the asset labels in your business applications. In a key-value pair, the key is the path to the asset label, and the value is the asset label in the translated language.

When you add custom assets or customize predefined assets, you might want to translate the changes. When you add an asset, the system adds a key-value pair that contains an English asset label to the English and other language translation files. When you update the label of an asset, the system updates the asset label in the English translation file. You need to update the corresponding value in the other language translation files.

To identify translation changes, you can compare the latest version of the English translation file with the previously translated version. You can then update the translations in the other language translation files.

If translations aren't available for some asset labels, the translations for the labels fall back to English. If you delete the key-value pair of a translated asset label from a language translation file, the previous translation is effective. If the deleted key-value pair wasn't translated, the translations fall back to English.

Translations for internal error messages are available only in English. You can translate your custom error messages for advanced rule associations. However, translations for error messages from rule specification fields are available only in English.

Sample English translation key-value pairs

The following sample shows the translation key-value pairs from the English translation file:

```
"//@businessEntity[guid='c360.organization']/@field[name='name'].label": "Name",
"//@relationshipSet[guid='hier1_hierarchy'].label": "Hierarchy",
"//@relationship[guid='c360.rel.organizationsubsidiaryorganization']/
@field[name='effectiveStartDate'].label": "Effective Start Date",
"//@relationship[guid='c360_organization_to_c360_organization_2']/
@field[name='relationship_status'].label": "Relationship Status",
"//@smartFieldTemplate[guid='smartFieldTemplate_PostalAddress'].label": "Address",
"//@sourceRankingTemplate[guid='Rank1'].label": "Rank 1",
```

Sample French translation key-value pairs

The following sample shows the translation key-value pairs from the French translation file:

```
 "//@businessEntity[guid='c360.organization']/@field[name='firstName'].label": "Prénom",
"//@relationshipSet[guid='hier1_hierarchy'].label": "Hiérarchie",
"//@relationship[guid='c360.rel.organizationsubsidiaryorganization']/
@field[name='effectiveStartDate'].label": "Date de début effective",
"//@relationship[guid='c360_organization_to_c360_organization_2']/
@field[name='relationship_status'].label": "Statut de la relation",
"//@smartFieldTemplate[guid='smartFieldTemplate_PostalAddress'].label": "Adresse
postale",
"//@sourceRankingTemplate[guid='Rank1'].label": "Rang 1",
```

CHAPTER 3

Managing translations

Before you manage translations, you must get the translation files that contain translations for the labels of predefined assets and upload them to the Business 360 data store. When you make changes to your business applications, the system automatically updates the English translation file. To manage the translations, ensure that all language translations align with the translations in the English translation file.

Prepare for the translation process

When you translate your business application for the first time, you need to prepare for the translation process.

To prepare for the translation process, perform the following tasks:

- "Step 1. Download and extract the translation files" on page 10
- "Step 2. Upload the translation files" on page 10

Step 1. Download and extract the translation files

When you perform translations for the first time, you need to download and extract the translation files.

1. Download the translation files bundle from the following location:

   Translation files bundle

   You can find the latest translation files in the **Latest files** folder. The **Old_archive** folder contains the older translation files.
2. Extract the ZIP file.
3. Select the language translation file that you want to use.

Step 2. Upload the translation files

Upload the language translation files that you downloaded and extracted. When you upload the language translation files, the translations for the predefined assets are available for business users. You don't need to upload the English translation file because the base language of the asset labels in your business applications is English.

1. Click **Localization** > **Translations**.
2. To upload the translation file, click the **Upload Translation File** icon beside the language on the **Translations** tab.

The **Upload Translation File** dialog box appears.

3. Select the translation file to upload, and click **Upload**.

   Change the language preference of your browser and view your business application in one of the translated languages that you upload.

Translation process

When you add custom assets or customize predefined assets, you need to translate your business applications. To translate your business applications, identify what you need to translate in your business applications. You can download the latest English translation to identify the asset labels that need translations. Translate the asset labels and review the translations in your business applications.

To translate, perform the following tasks:

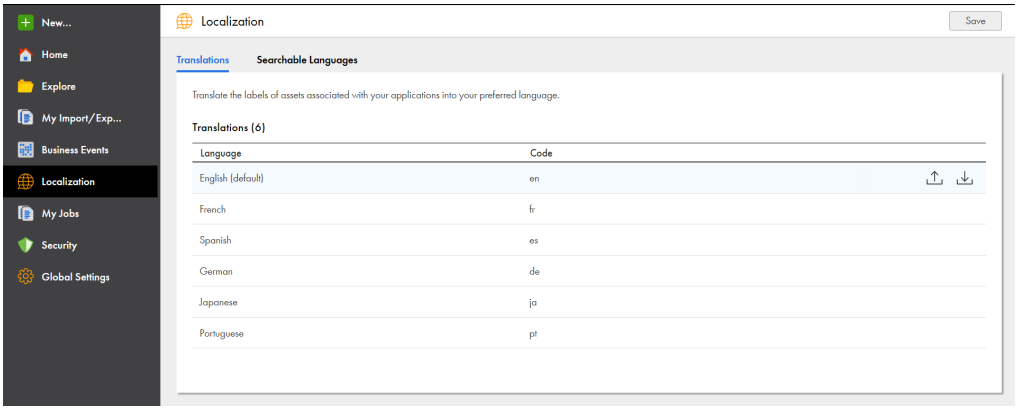

1. "Step 1. Download translation files" on page 11
2. "Step 2. Identify and translate changes" on page 12
3. "Step 2. Upload the translation files" on page 10
4. "Step 4. Review the translations" on page 13

Step 1. Download translation files

Download the translation file for the language into which you want to translate your business application. For subsequent translations, download the English translation file or language translation file to identify changes from an older version.

1. Click **Localization** > **Translations**.

2. To download the translation file for a specific language, click the **Download Translation File** icon beside the language on the **Translations** tab.

The translationfile-<language>.json file is downloaded to your system.
Share the English and language translation file with the translators. For subsequent translations, share the earlier version of the language translation file to identify changes.

Step 2. Identify and translate changes

To update translations, determine the changes by comparing the latest version of the translated language file with the previous version.

When you add an asset or update the label of an asset, the system adds a key-value pair that contains an English asset label to the English and other language translation files. You need to update the corresponding value in the other language translation files.

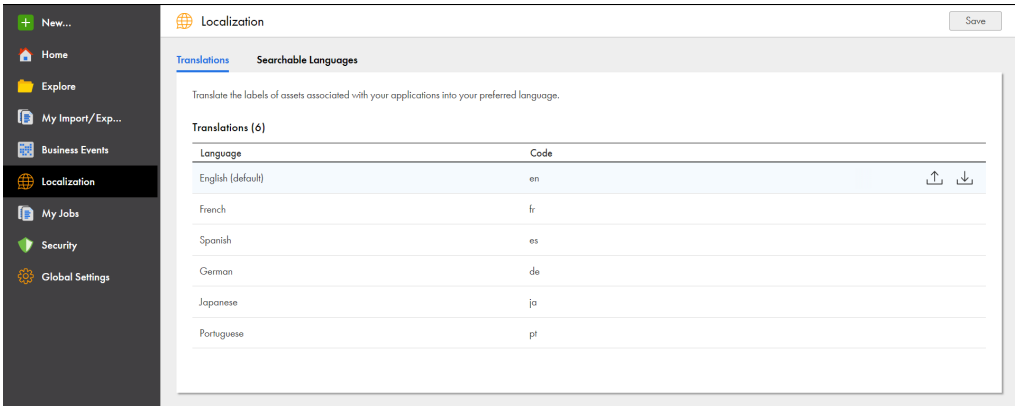

To determine translation changes, compare different versions of language translation files. Identify the list of keys that require translations. Search for the keys and update translations for the identified keys in the language translation file.

Step 3. Upload the updated translation file

Upload the updated translation file to the Business 360 data store. You can upload the translation file with all the key-value pairs or the updated key-value pairs. When you upload the translation file, the system updates only the new or updated translations. The system doesn't replace the existing translations that didn't undergo any change.

Ensure that the file size doesn't exceed 5 MB and that the file contains valid translation keys.

1. Click **Localization** > **Translations**.
2. To upload the translation file, click the **Upload Translation File** icon beside the language on the **Translations** tab.

The **Upload Translation File** dialog box appears.

3. Select the translation file to upload, and click **Upload**.

   If there are no validation errors, the file uploads successfully.

4. If validation errors appear, fix the errors and upload the translation file again.

Step 4. Review the translations

To ensure that the translations are accurate, review the translations in your business applications.

Before you review the translations, set the language preferences of your browser to the translated language of your business application and refresh your business application. If you have set the language preference of your browser in the order of French, Portuguese, and English, translations appear in the order you have set the language preferences of your browser.

Open your business application and navigate to the asset labels with new or updated translations and review the translations.

Troubleshooting translation file import

When you import a translation file into the Business 360 data store, the import might fail. To troubleshoot the issue, understand the error, it's cause, and how to resolve it.

Error

When you download a translation file from a source organization and import it into a target organization, the import fails with the following error:

```
Can't process translationfile-en (15).json because of incorrect content. Verify the file and try again. GUID of metadata object in 'c360' namespace should start with 'c360.'.
```

Cause

This issue occurs if your source organization contains custom reports that were created before the October 2025 release. MDM SaaS validates the namespace parameter in the metadata object and checks if the parameter starts with the name of the business application, such as `c360.`.

Custom reports created before October 2025 are saved with a namespace parameter that doesn't include the business application name. When MDM SaaS extracts these metadata objects from the translation file into the target organization, the import fails.

Note: If your custom reports were created after the October 2025 release, the import succeeds and no action is required.

Resolution

To resolve the error, perform the following steps:

1. Export and reimport the report set in the source organization
    a. In the source organization, navigate to the **Explore** page.
    b. Filter the report set of the business application that contains custom reports.
    c. To export the report set, click **Export**.
    d. Import the downloaded report set into the source organization.

    Note: When you import the report set back into the same organization, MDM SaaS automatically removes the namespace parameter from the custom reports.
2. Download the translation file from the source organization
    a. Click **Localization** > **Translations**.
    b. On the **Translations** tab, click the **Download Translation File** icon beside the language.
3. Upload the translation file to the target organization
    a. In the target organization, click **Localization** > **Translations**.
    b. On the **Translations** tab, click the **Upload Translation File** icon beside the language.
    c. Select the translation file to upload, and click **Upload**.

Maintain versions of translation files

Maintain versions of the translation files to identify the changes between different versions and if required, restore translations.

When you upload a translation file, Business 360 doesn't maintain versions of the translation file. To review or revert to an older version of the translations, save the versions of the translation files that you download on your system.

You can use different versions of the translation file to compare and identify changes to translate.

If you accidentally upload an incorrect translation file or are uncertain about the updated translations, you can revert the changes. To revert the translations to an earlier version, you can upload the earlier version of the translation file from the versions you maintain.

CHAPTER 4

Managing searchable languages

You can now specify the languages that users can use to search for records in business applications. You can search for records in English and Japanese.

After you add the preferred languages for search, configure search properties for business entity fields.

For more information about configuring search properties for business entity fields, see *Define the data model*.

Users can select English and Japanese as the search language on the following pages in business applications:

- Global search
- Saved search
- Filtered search
- Related records search
- Add related business entity records
- Add first level node to a hierarchy
- Add child records to a hierarchy

Add languages for search

You can add the languages that users can use to search for records in business applications.

1. Click **Localization** > **Searchable Languages**.
2. To add a preferred language, on the **Searchable Languages** tab, click **Add Language**.
3. Select a language from the list.

   Default is English.
4. Click **Save**.

Delete languages for search

You can delete a language that you added as a preferred language for search. When you delete the language, business users can't search for the records in that language.

1. Click **Localization** > **Searchable Languages**.
2. Hover over the language that you want to delete, and click **Delete**.
3. Click **Save**.

   After you delete the language, business users can't view **Japanese - JA** as the search language in business applications.

After you delete the language, ensure that you run the generate search indexes and match keys job to reindex the business entity records.
For more information about defining the search indexes and match keys job, see *Define jobs*.
