Business 360 Console

Fixed issues

The tables in this section describe recent fixed issues for Business 360 Console. Note that some releases might not include fixes.

October 2026 fixed issues

Issue	Description
MDMN-219281	When you add a match model while a match model deletion job runs simultaneously, the Field Name and Filter Candidates By lists disappear from the Add Match Model page.
MDMN-218828	When you use the Update Source Record REST API to update source records that have multiple address field group entries, the update fails if an address ID contains a line break.
MDMN-216012	When you run multiple Match and Merge jobs at the same time, the jobs fail at the merge step.
MDMN-213247	When you configure a Directed AI match rule with a fuzzy match strategy and type a space in the search box of the Field Name list, the list closes unexpectedly.
MDMN-212094	When you run a generate search indexes or match keys job to generate match keys and a temporary connection error occurs, the job doesn't complete and you can't run subsequent match and merge jobs.

Issue	Description
MDMN-212054	When you create or update records for a business entity configured with multiple data quality rule associations, the response takes more time than expected.
MDMN-211552	If a purge job fails and restarts, the job metrics show only the records that the final run purged.
MDMN-210614	When you run a match and merge job and the match process selects a large number of candidate records for each record, the job fails with an out-of-memory error.
MDMN-209416	When you run a match and merge job, the job intermittently remains in the Running status and doesn't complete.
MDMN-208723	The purge business entity job doesn't purge source records that have no associated master record.
MDMN-208208	After you run the migrate rule associations job, ingress jobs fail at the transform step with the following error: `Zero input records found`
MDMN-207354	The reprocess master data job doesn't process records that reflect the latest data enrichment, validation, and survivorship configurations. However, the job updates the last updated date for these records.
MDMN-206978	When users assigned to custom user roles with record-level data access rules try to export search results, the export fails with an internal server error. The failure is consistent for larger search results and might occur intermittently for smaller search results.
MDMN-200475	After you migrate basic rule and advanced rule associations that use the same input and output fields, MDM SaaS might run the rule associations in parallel during batch processing. MDM SaaS doesn't enforce the order in which the rule associations run, so the value that MDM SaaS writes to the output field of the master record might differ between runs.
MDMN-201932	You configure a rule association to clear a field value. When users apply changes to a section, the rule association runs but doesn't clear the field value. However, the rule association clears the field value only when users submit the record.
MDMN-201503	When you click the Application Integration process link in a data enhancement rule, the Application Integration home page opens instead of the process.
MDMN-195649	When you create a record with more than 1,500 field group entries and configure an advanced rule association on a field in the field group, data quality processing times out.
MDMN-193353	When you use the Search REST API with the AND operator to search for records with multiple field group entries, MDM SaaS returns inaccurate results.
MDMN-192444	When an API request exceeds 60 seconds, you receive a timeout error, but MDM SaaS continues to process the request after the error.
MDMN-186818	When you enable the option to reject records with validation errors, the error messages and rule association names appear in English instead of the browser language.
MDMN-175975	When users apply changes to a section, the record stops responding if rule associations that use Application Integration-based enrichment and cleansing plugins are configured to create a new field group instance.

July 2026 fixed issues

Issue	Description
MDMN-206917	When you try to delete an invalid data access rule in the Data Access Rules tab on the Security page, the operation fails.
MDMN-205196	When you update source records through an ingress or file import job, the job rejects records with source primary keys that don't match existing source records. The load step error summary doesn't include rejected records in the failed-record count.
MDMN-204938	When you run an ingress job using Business 360 Connector in an organization that's migrated to use Enrichment and Validation Orchestrator, the job fails at the transform step.
MDMN-203726	When you associate picklists in a business entity with code lists from Reference 360 on the source system page, MDM SaaS doesn't display the picklists whose reference data contains custom code lists with Enterprise in the name.
MDMN-202468	An ingress job that uses Business 360 Connector fails during the mapping task initialization phase with the following error: `Operation failed: Please provide correct path for the Object. [Home] was not found".`
MDMN-202368	When you run an ingress job that uses Business 360 Connector to add a root node to a hierarchy instance, the job fails in the load step and doesn't add the root node.
MDMN-200995	After you migrate your organization to use Enrichment and Validation Orchestrator, if you modify the function of an existing advanced rule association from transformation to validation and save the business entity, MDM SaaS displays the following error: `Cannot create enrichment and validation orchestrator assets for existing data quality rule associations in the business entity because of an internal error.`
MDMN-200681	After you migrate assets, if you delete a rule association in the source organization and reimport the assets into the target organization, the previously imported rule association that uses Enrichment and Validation Orchestrator is retained in the target organization. You can't delete the business entity because the deleted rule association that's retained is dependent on the business entity.
MDMN-199063	When a business entity contains empty objective groups and objective groups with validation rule associations, error messages for input fields that fail validation don't appear after a validation rule association runs.
MDMN-197525	When you run ingress or egress jobs with taskflows that contain 70 or 80 concurrent mapping tasks with Reference 360 assets, the jobs fail because of timeout error.
MDMN-197399	When you enable source records and their patch records for matching, the match process enables the source records but excludes their patch records.
MDMN-194245	When you run an ingress job to import records to multiple business entities, the job might fail while generating match keys for some of the business entities. This issue occurs because the match process doesn't correctly identify the match fields of the business entities.
MDMN-188116	If you use the Merge API to merge a record that's already merged, MDM SaaS creates redundant approval tasks with no actions to apply.
MDMN-179324	When you add two consecutive notification tasks in a taskflow in Data Integration and add the taskflow to an egress job, MDM SaaS doesn't load the taskflow.

Issue	Description
MDMN-177450	The Person business entity incorrectly displays the maximum length as 255 for the Prefix Number field in the Phone field group.
MDMN-164984	When you configure rule associations to downgrade trust scores and run ingress or file import jobs with update or patch operations, the trust scores aren't recalculated. However, if you use the upsert operation, the trust scores are recalculated.
MDMN-164821	When you run a merge job and a temporary service interruption occurs, MDM SaaS incorrectly displays the job as failed even though the merge process continues to run.
MDMN-158518	When you run an ingress job and the index for search step fails with an out-of-memory error, MDM SaaS retries the step multiple times before displaying the step as failed.
MDMN-157244	After you import a predefined business application, the roles assigned to pages and search layout components aren't included in the target environment even though the import job is successful.

April 2026 fixed issues

Issue	Description
MDMN-203807	If you map the egress fields in the target transformation, an ingress job that uses Business 360 FEP Connector rejects all records during the load step. The issue occurs in organizations that use Enrichment and Validation Orchestrator.
MDMN-197547	When you import a business entity, the import job fails if another business entity with the same name exists in a different folder.
MDMN-195089	When you ingress the same records with business IDs multiple times, the match process changes the match and merge status of those records from CONSOLIDATION INDEXED to MATCH INDEXED. The status change happens even if the records have no updates.
MDMN-192936	An egress job continues to run even after its associated taskflow is suspended.
CLDDI-45988 MDMN-190170	If your organization uses the JWT authentication type, when you start the mapping creation process in Business 360 Console, Data Integration doesn't automatically map the fields between the source and target transformations.
MDMN-189982	When a boolean field within a nested field group entry has an advanced rule association, saving changes to records causes the following error: `Failed to execte DQ rule.` This issue occurs when multiple field group entries exist and they contain nested field groups with the same internal ID.
MDMN-188300	When you create a match model with Japan as the default population and include Product_Description or Product_Name field types in the candidate selection criteria, the match process doesn't generate match keys.

Issue	Description
MDMN-185996	When you create basic, advanced, and DaaS rule associations in organizations created after the October 2025 release, MDM SaaS creates a predefined objective group for the business entity. The predefined objective group contains objectives with rule associations that are equivalent to the basic, advanced, and DaaS rule associations. If you try to delete the business entity, MDM SaaS doesn't allow you to delete the business entity because of dependent rule associations. You can't delete business entities that contain rule associations equivalent to DaaS rule associations.
MDMN-185565	If a field and its field group share the same internal ID and users enter a single-digit value in that field and apply changes, an error appears in the business application. Workaround: Ensure that a field and it's field group have unique internal IDs.
MDMN-185253	When a workflow is configured to trigger on updates to specific fields, the workflow is triggered when those fields are modified from the user interface but not from the REST API.
MDMN-184970	After you create a data enhancement rule with the Data Quality - Validation or Transformation plugins and select a rule specification from Data Quality, if you use the same rule specification and create an advanced rule association, MDM SaaS fails to save the business entity. However, if you create an advanced rule association first and then create a data enhancement rule with the same rule specification, the issue doesn't occur.
MDMN-184956	When you configure rule associations in objective groups that are equivalent to basic and advanced rule associations and don't enable rule associations to run even if all input fields are empty, MDM SaaS runs rule associations. However, the Data Quality Status tab in business applications incorrectly displays the status of the rule association as Success.
MDMN-184885	An import job fails if a business entity name contains special characters, such as apostrophes (') or accented letters, such as á.
MDMN-184550	When you configure basic, advanced, and DaaS rule associations in organizations created after the October 2025 release, MDM SaaS creates a predefined objective group for the business entity. The predefined objective group contains objectives and rule associations that are equivalent to the basic, advanced, and DaaS rule associations. If you import the predefined objective group into another organization, the migration fails on the first attempt.
MDMN-182944	When you run a purge job to purge all records across business entities, the index for search step runs indefinitely.
MDMN-182263	MDM SaaS incorrectly allows deletion of the predefined Internal File Import job definition, which causes errors during file import operations.

Issue	Description
MDMN-143347	When you run an ingress job, the metrics of the index records for search step incorrectly display count of records that are indexed in the latest run. The metrics don't include the count of records that were previously indexed.
MDMN-141876	An advanced rule association for a field in a field group doesn't run on empty input fields even though the rule is set to run on empty input fields. This issue occurs when the input field doesn't contain a value in any of the field group entries.

October 2025 fixed issues

Issue	Description
MDMN-183336	A match and merge job that uses a match model with an extended key generation level for generating match keys for candidate selection fails.
MDMN-183310	If users create records while a Generate Search Index and Match Keys job is running, the job fails.
MDMN-181866	An egress job that uses Business 360 FEP Connector to export hierarchies fails during the extract step if node names within the hierarchies exceed 75 characters.
MDMN-180203	When you run an egress job that uses Business 360 FEP Connector to export all records and two nested field groups share the same source primary key, the exported data includes only one of those nested field groups.
MDMN-176081	When users search for records in business applications, the search result don't show the field configured as the title in the search layout components page, if the field is of integer data type.
MDMN-179583	In Operational Insights, when you filter jobs, the Reference 360 usage statistics become null.
MDMN-179392	After you update the search configuration of system fields and save and index the business entity, when users search for records in business applications, the search doesn't return any records.
MDMN-176015	When you run an egress job, the extract step takes a longer time to complete even though taskflows are run successfully in Data Integration.
MDMN-174924	When a taskflow of an egress job is suspended, MDM SaaS doesn't automatically clean up backend files related to the job. However, MDM SaaS continues to run other jobs causing performance issues.
MDMN-173090	When you ingress or import records, the index for search step fails if the searchable fields contain values with special characters, such as ¶, Â¦ . Subsequently, the ingress or import job fails. Additionally, the Error Records metric in the index for search step doesn't display the total number of failed records.
MDMN-169707	A Search Match API request that searches for null values fails.

Issue	Description
MDMN-167206	While you edit a business entity, if you delete it, and then try to save the changes, an error message appears. However, the save succeeds on the second attempt.
MDMN-165821	When you purge data, the job appears failed even though the Purge BE Activity Report Index step of the job still continues to run.
MDMN-156527	If you enable a field that's disabled in a business entity, and then enable the field, MDM SaaS removes the existing privileges for the enabled field. This issue occurs only if you update privileges for another field in the same business entity before enabling the disabled field.
MDMN-137163	When you add or import values to integer data type fields through business applications and ingress jobs, MDM SaaS might reject the field values or include incorrect values. Additionally, data quality rule associations configured on these fields might return inaccurate validation results. This issue occurs when the integer value contains more than eight digits.

July 2025 fixed issues

Issue	Description
MDMN-173633	After you delete a field group entry in a business application and run an egress job, the exported data incorrectly shows the status of the field group entry as active.
MDMN-173621	If the source primary key of a field group contains invalid special characters, an ingress job fails during the load step.
MDMN-172993	Using the same internal ID for a root field and a field within a field group causes an error when you create a record in a business application.
MDMN-172885	When you run an egress job that uses Business 360 FEP Connector, the exported data doesn't contain any value for the nested field groups with names in the following format: `Level<number>_<field group name>_<parentId>`.
MDMN-172760	When you run a match and merge job to reset matched records for a specific business entity, the job resets matched records in all business entities.
MDMN-171395	When you try to disable an advanced rule association, MDM SaaS doesn't save the rule association and displays the following error: `Map the applied fields to an input or output rule specification field.` This issue occurs when the field configured for the advanced rule association is mapped to an output field of the rule specification.
MDMN-171327	When you use the EQUALS filter comparator, the Search REST API doesn't return records for fields that are set as searchable.
MDMN-170849	Configure a field with an advanced rule association that uses a rule specification field for the error message. If a field value fails validation, you get the rule association name instead of the error message.

Issue	Description
MDMN-169582	When you delete an entry of a field group that's disabled from surviving as a block and configured with minimum or maximum survivorship rules, field values from the deleted entry might survive.
MDMN-168995	A business application doesn't automatically time out after the session idle timeout period.
MDMN-168981	On the View and Edit page of a business entity, when you select a field in one section, another field in a different section is incorrectly selected along with the selected field.
MDMN-167171	When you run an egress job to export deleted relationships, the job fails to export a relationship if any record in the relationship is deleted.
MDMN-157220	When you update the address values of existing records in real time, MDM SaaS doesn't enrich the address values. However, when you create records, MDM SaaS enriches the address values.
MDMN-157206	When you configure the highlighted field for a Page Header component, the Business ID system field doesn't appear for selection.
MDMN-148496	When you use the Create Master Record REST API to create a record for a business entity that has basic and advanced rule associations, MDM SaaS validates the field values. However, if the validations fail for both basic and advanced rule associations, MDM SaaS displays validation messages only for the basic rule association in the response.
MDMN-148242	When a record that belongs to a hierarchy is pending approval, the process hierarchies job fails. The issue occurs if the record awaiting approval has records that inherit dynamic field definitions from the record. Workaround: Before you run a process hierarchies job, ensure that no record has pending changes awaiting approval.
MDMN-140258	When you save an integrity check to validate a business entity record field, you get the following error: `Error saving the integrity check rule.` Workaround: Close the Add Integrity Check dialog box and refresh the Data Quality tab.
MDMN-140177	When the Create Master Record API is used to create records with null picklist values, you can't find or view the records in business applications or by using the Search API.
MDMN-96376	If a data access rule has conditions on a field that isn't searchable or conditions on relationship attributes or related business entity attributes, the search requests don't work as expected for custom user roles. If more than 10000 records exist for the business entity, when a user with the custom user role searches for records, the search results page doesn't retrieve matching records.

May 2025 fixed issues

Issue	Description
MDMN-169072	When you run a match and merge job to match source records that contain null values, the match process doesn't generate record pairs for records with null values. This issue occurs when declarative rules use the threshold-based merge strategy.
MDMN-169066	If you update the source system of an ingress job for the second time and save the job, an error message appears.
MDMN-166766	When you add business entities to a business application, you can select disabled URL fields as display fields.
MDMN-164565	When you update a source record by using REST APIs, the rule associations for data enrichment are triggered even though you can enrich only master records.

April 2025 fixed issues

Issue	Description
MDMN-167195	When you try to remove a rule association from an objective or disable an objective, Business 360 Console stops responding.
MDMN-165203	When you run an egress job to export relationships in a hierarchy using Business 360 FEP Connector, the egress job doesn't export any records.
MDMN-165109	When you set the browser locale to Japanese, you can't configure segment matching for declarative rules that contain Boolean fields.
MDMN-165104	You can publish a match model even if the model doesn't contain declarative rules or a completely trained ML model.
MDMN-164343	When you migrate predefined assets, the migration fails even though the corresponding licensed business application is set up in the target organization.
MDMN-163981	You can save a business entity without specifying an internal ID for its fields.
MDMN-163716	When you run an ingress job, the transform step fails intermittently because the Cloud Application Integration processes time out.
MDMN-163682	Basic rule associations for fields in a field group with multiple picklists return incorrect values when the rule associations use one of the picklists as input.
MDMN-163607	When you render a field group as a table and fields within the field group contains errors based on the rule associations, the validation messages don't appear for the fields in business applications.
MDMN-163147	After you remove a business entity of a business application and migrate assets, the import fails because the references to the business entity isn't removed.
MDMN-161206	After you ingress records that match existing records in MDM SaaS and then run a match and merge job, the job doesn't generate record pairs for some of the matching records.
MDMN-160917	A search reindex job fails for a business entity that has more records in deleted state than the records in active state.

Issue	Description
MDMN-160751	When you run a Search Match API request that uses a match model with a candidate filter to match records, the API returns records that don't match the filter criteria.
MDMN-160328	When you configure advanced rule associations with transformation functions on picklists and then import records that contain invalid picklist values, MDM SaaS generates invalid picklist values, which subsequently get imported.
MDMN-159699	The Create Master Record API fails to run again when the following error appears: `Retryable transaction timeout.`
MDMN-159136	When you run an ingress job, MDM SaaS doesn't run the configured advanced rule associations if the mapped field name in Cloud Data Integration contains an underscore as a prefix followed by the business entity name. This issue occurs when business entity names start with numeric values or special characters.
MDMN-158554	When you create a reference data asset in Business 360 Console with an apostrophe (') in the display name, the asset creation page continues to load indefinitely without displaying an error message.
MDMN-158546	When you update the search configuration of a business entity and search for records using the Search REST API with a model version that's later than the current model version, the API doesn't return any results.
MDMN-158168	When you run an ingress job with a large volume of data, MDM SaaS skips the rule associations for some records. This issue occurs because of internal errors in the source and target transformations in Cloud Data Integration.
MDMN-157990	When you upgrade your organization to the latest release version and run an ingress job, the job fails at the Index for Search step with the following error: `Cannot index the records. Recreate the indexes for the Person business entity and try again.` This issue occurs because the upgrade action internally changes the business entity to the `REINDEX_REQUIRED` state, which requires you to reindex the records.
MDMN-157129 MDMN-162367	When users submit a record after they delete a field value in a field group, the following error appears in business applications: `Failed executing RuleAssociation:'<Rule_Internal_ID>'.` This issue occurs when you configure advanced rule associations for fields in a field group and enable the rules to run even if all input fields are empty.
MDMN-155369	When Informatica deploys the latest release updates, your organization might face intermittent errors in the Cloud Application Integration processes.
MDMN-154117 MDMN-153835	When you edit records with errors on the record details page or in the workflow inbox, the validation error type incorrectly changes from Information to Others.
MDMN-152976	When you configure a decimal field with a scale of 0 and import records that contain decimal values with trailing zeros, such as `1.00` or `1,00`, and run an ingress job, the job imports these values without any error. However, when you edit these records in business applications, the value incorrectly appear as `1,00` instead of its actual decimal format.

Issue	Description
MDMN-151413	When you configure a DaaS real-time rule association on address fields and create records, MDM SaaS takes about two seconds to enrich the address values after the record is created.
MDMN-146190	When you configure basic rule associations for picklists to run even if all input fields are empty, MDM SaaS doesn't apply these rule associations to the picklist fields. If users create a record without adding values to picklists in business applications, MDM SaaS displays the following error: `Something went wrong when we tried to render this panel.`
MDMN-144963	The translation files don't contain any labels associated with the match and export data feature.
MDMN-141310	Custom reports that are deleted in business applications appear in Business 360 Console.
MDMN-133109	After you configure a page for each step of a custom workflow, when an approver views a create task in the Workflow Inbox, the page incorrectly shows components that aren't part of the Create page.
MDMN-130067	After you configure a DaaS rule association for real-time address verification on an address field group and map specific fields, MDM SaaS incorrectly runs the rule association on unmapped fields in the address field group. This issue occurs when you update these unmapped fields in business applications.
MDMN-65426	The Merge API can't merge master records that have more than 1000 source records.

Known issues

The tables in this section describe known issues for Business 360 Console. Not all monthly releases include known issues.

October 2026 known issues

Issue	Description
MDMN-222559	When you run an ingress job that includes both update and delete functions on specific fields in multiple entries of the same field group, the delete functions fail. For example, a record with the name John has a home entry and an office entry in the address field group. If you run an ingress job that updates the city value in the home entry and deletes the state value in the office entry, the job updates the city value. However, the job doesn't delete the state value. Workaround: Import records in two separate ingress jobs, one for the update functions and one for the delete functions.
MDMN-220191	When you delete a report from a business application and then try to delete the associated business entity, the deletion fails with a dependency error. Workaround: To fix the dependency error, contact Informatica Global Customer Support.

Issue	Description
MDMN-212643	If you create a field with an internal ID that ends with _src_sgst, MDM SaaS fails to index the records as this suffix is a reserved keyword for the auto-suggest search feature. Workaround: Don't create a field with an internal ID that ends with _src_sgst.
MDMN-204806	When you select a particular dynamic field value attribute in the facets section of a search layout, the search results might not display the dynamic fields from the selected dynamic field values attribute or might display fields from a value that you didn't select. The issue occurs when a business entity has multiple dynamic field values attribute.

July 2026 known issues

Issue	Description
MDMN-217554	If you update the name of a picklist field value, the business event payload for this update contains the previous name instead of the updated name.
MDMN-209923	If you don't have licenses for DaaS Real-Time Email and Phone Verification, rule associations don't enrich email addresses and phone numbers. However, the Data Quality Status tab in business applications incorrectly displays the status as Success.
MDMN-205856	When you remove an input field from a rule specification or Application Integration process, the import of associated data enhancement rule and rule associations to an organization where the assets already exist fail. Workaround: Remove the outdated field mappings from the associated rule associations and migrate them first. Then, update and migrate the data enhancement rule.

April 2026 known issues

Issue	Description
MDMN-205365	If you map the egress fields in the target transformation, an ingress job that uses Business 360 Connector rejects all records during the load step. The issue occurs in organizations that use Enrichment and Validation Orchestrator.
MDMN-194652	When you ingress records with field values that exceed the maximum field length, the ingress job rejects the records.

October 2025 known issues

Issue	Description
MDMN-189921	When you pull a renamed asset from the source control repository, the pull operation fails.
MDMN-188532	After a record fails validation by a rule association, disabling the rule association doesn't change the record's invalid status, even though the related validation errors aren't displayed.
MDMN-187519	After you run a file import job, the load step might show incorrect values in the sub-metrics. This issue occurs when the POD runs on Oracle Cloud Infrastructure.

Issue	Description
MDMN-186818	When you enable the option to reject records that fail validation for an objective, MDM SaaS doesn't display localized error messages even after you update the translation file with them.
MDMN-186699	When a purge job runs, the job permanently deletes records, search, and report indexes of the specified business entity during the Purge Records step. However, the job details page incorrectly displays two obsolete steps, Index for Search and Purge BE Activity Report, without any metrics.
MDMN-186460	When an objective is triggered on a master record, the list of source records that's sent to a plugin also includes the internal source records associated with relationships. Workaround: Ignore the internal source records associated with relationships. Ensure that your business logic doesn't process those source records.
MDMN-185836	When enrichment and validation rule associations run on a field that a user doesn't have access to, MDM SaaS fails to save the record with the enriched data.
MDMN-185557	When a user edits a record and applies changes to a section, all objectives associated with all fields in the section run instead of only those associated with the changed fields.
MDMN-185422	DaaS rule associations for real-time address verifications run even when users apply changes to a section instead of running only when users submit records.
MDMN-185404	The translation file doesn't include key-value pairs for objective names, so you can't localize them.
MDMN-185095	When you open a custom asset and edit its properties by updating the location, the asset is not moved to the new specified location.
MDMN-181443	When you run an egress job to export records in a hierarchy, the exported data incorrectly includes deleted records even though the record state indicator is set to active.
MDMN-180846	When you configure a source system and associate code lists to picklists for a business entity that's checked out, MDM SaaS saves the source system configuration. However, if you undo checkout on the business entity, MDM SaaS removes the latest configuration of the source system. Workaround: To retain the configuration of the source system, ensure that you check in the business entity.
MDMN-175253	When users export search results that belong to a business entity with error remediation enabled, the exported data incorrectly includes a blank column named _id column.
MDMN-173052	The Rejected Records report that you download from the load step of an ingress or file import job doesn't include reasons for validation failures of records.

July 2025 known issues

Issue	Description
MDMN-180169	After a user updates a record in a business application, the user is able to submit the record with validation errors even though an associated objective is configured to reject records that fail validation.
MDMN-177655	When you configure a dynamic pool, if you undo a change, subsequent changes that you make aren’t saved.

April 2025 known issues

Issue	Description
MDMN-168990	When you download a match output report, the download might fail, or the downloaded report might not contain the maximum number of 150,000 record pairs.
MDMN-168554	If you create a record through the business entity record API using the internal ID of a deleted business entity, the API creates the record instead of displaying an error.
MDMN-166521	An Update Source Record or Update Source Record Field API request doesn't trigger an approval workflow even though the updated fields were configured to trigger a workflow.

February 2025 known issues

Issue	Description
MDMN-156256	In Operational Insights, the usage summary metrics don't include the count of source and master records that are in MATCH DIRTY status for merge history activity report.
MDMN-156176	Validation errors might not appear when you view a record but appear when you edit the same record. This issue occurs with records that fail validations during the ingress or import process because of advanced rule associations for fields that depend on the values of other fields.
MDMN-144529 MDMN-155578	After you restore a master record, the master records count isn't updated in the MDM SaaS usage statistics that you can view in Operational Insights. Workaround: Contact Informatica Global Customer Support.

November 2024 known issues

Issue	Description
MDMN-156186	After you merge two source records and run an egress job to export the incremental data, the exported data doesn’t display the updated business ID of the master record for the source records.
MDMN-155261	Operational Insights might display an incorrect number of users in an organization. The user count doesn't include users assigned to user groups.
MDMN-131168	On the View and Edit page, the tip text field appears editable for a root field even though you select the Hide label option.

October 2024 known issues

Issue	Description
MDMN-157663	When you search for records with the Search REST API, the request takes a longer time to retrieve a response.
MDMN-155380	When you merge records that belong to a business entity with deduplication criteria configured for a field group, the nested field group entires are incorrectly highlighted on the Source Records page.
MDMN-155127	When a user with the update privilege edits an empty field, the following message appears: `Failed to update the record` Workaround: Assign the create privilege to the user.
MDMN-154414	After you enable error remediation for a business entity, add a basic or advanced data quality rule association to a field in a nested field group. When you enter an invalid value in the field, the validation error appears. However, after you apply the changes, the validation error disappears.
MDMN-153443	After you update an Application Integration process that you use in a data enrichment configuration, the changes aren't automatically reflected in the rule association and the data enhancement rule assets.
MDMN-152949	After a DaaS rule association validates a record that you added or updated, a warning message appears for incorrect addresses, although error remediation is disabled for the business entity.
MDMN-152511 MDMN-152509	When you export all the deleted records in a hierarchy, the exported data contains inaccurate results.
MDMN-152443	When you run an egress job to export a hierarchy that contains less than 1000 records, the exported data might contain duplicate records.
MDMN-151068	After you disable error remediation for a business entity, if business users export search results, the exported data incorrectly includes additional columns, such as field group ID, severity, and error message. Workaround: Ignore the additional columns.

Issue	Description
MDMN-151915	After you purge data and disable the error remediation property for a business entity, business users still see validation errors and error type filters in a saved search. Workaround: Ignore the filter values because they don't impact the search results.
MDMN-150933	When you create an egress job to export master records and the identifier details of the associated source records, the Assets section incorrectly displays the option to select the record type.
MDMN-150872	When users select values for business entity record fields and submit records for approval, business applications might display the following error: `Can't send the changes for approval because no user is authorized to approve these changes.` The issue occurs when all approvers assigned to a custom user role are denied access to records based on the conditions set in a data access rule.
MDMN-150328	When you create a record through business entity record APIs, the response payload differs depending on whether error remediation is enabled or disabled for the business entity.
MDMN-144892	You can't delete or disable objective groups that you create for data enrichment.

August 2024 known issues

Issue	Description
MDMN-150252	When you associate a multi-step approval workflow with a custom View and Edit page of a new or a purged business entity, submitting records for approval fails. The following error message appears: `Can't START the already STARTING record.`
MDMN-147450	When you configure a picklist with a code list from Reference 360 that contains multiple code values with identical codes, the filters in business applications don't display all the picklist values. Additionally, the search results count incorrectly includes all records that contain duplicate code values.
MDMN-147447	When you search for records in business applications, the filters display the old picklist values instead of the updated values.

July 2024 known issues

Issue	Description
MDMN-147911	When you import a report to an organization, the imported report doesn't appear on the **Reports** page of business applications. Workaround. Export the Report Set asset from one organization, and then import the Report Set asset to another organization for the reports to appear in business applications.
MDMN-144467	After you import a business entity with fields that are enabled for multilingual search, business users can't search for records in their preferred language. This issue occurs if you configure an additional search language in the target organization after you import the business entity and don't reindex the business entity records. Workaround: To search for records in the preferred language, perform one of the following tasks: - Before you import the business entity, configure the additional search language on the Localization page in the target organization. - After you import the business entity, if you configure an additional search language in the target organization, run the Generate Search Indexes and Match Keys job.
MDMN-144327	After you create a record and run an automated merge job, the metrics for the merge process event show the count of both ingressed and automatically merged records.
MDMN-144009	A calculated field of a record might not contain the correct value after a record that contributes to the value is deleted. The issue occurs if the deleted record is related to the record with the calculated field through a business entity record attribute.
MDMN-142225	When you use a PATCH request to update field groups by passing invalid data as an object and not an array, the trust scores are downgraded incorrectly.

May 2024 known issues

Issue	Description
MDMN-140177	When the Create Master Record API is used to create records with null picklist values, you can't find or view the records in business applications or by using the Search API.

April 2024 known issues

Issue	Description
MDMN-137821	After you update the search configuration, if users run a saved search that contains fields that are no longer searchable, they get the following error: `Search API service failed.` Workaround: Users must remove the non-searchable fields from their saved searches.
MDMN-137389	In Operational Insights, when you view the ingress job metrics, the number of imported records appears inconsistent between the job instance and performance details panels.
MDMN-137149	When you add a record-level data access rule for a custom user role with approval privileges, the user can't view the title of the workflow task in the business application. Workaround: Modify the record-level data access rule to an attribute-level data access rule, or delete the data access rule.
MDMN-136856	When you create a record that has the same custom business ID as another record, the created record appears as an updated record in the workflow task. The issue occurs when you use the Create Master Record API to create a record that must go through the approval workflow.
MDMN-136631 MDMN-136187	When you configure the properties of business entity fields, you can't view all the validation messages because the validation panel doesn't have a scroll bar.

February 2024 known issues

Issue	Description
MDMN-135421	When you import or export data that contains date fields to and from MDM SaaS, the system decrements the dates prior to 1582 by 10 days.
MDMN-135207	When a source primary key in a REST API request URL contains the caret character (^), the API request fails.
MDMN-131460	Users with the Product 360 Read Only and Supplier 360 Read Only user roles can't view the **Hierarchy** tab of a record even though they can view the **Hierarchies** page in a business application. Workaround: Create a custom user role with read-only privilege for the **Hierarchy Component** on the **Security** page and assign the custom user role to users.
MDMN-129899	When you download the match output report of a match and merge job, the record pairs count in the report might not be the same as the count that appears on Business 360 Console. The issue occurs if another match and merge job runs after the match and merge job for which you downloaded the report. Workaround: To view the correct match report output, download the report immediately after the job completes.

November 2023 known issues

Issue	Description
MDMN-123482	When you export hierarchies and relationships that belong to a specific source system by using Business FEP Connector, the egress job exports hierarchies and relationships from all the source systems.
MDMN-122466	On the Explore page, when you view the dependencies of a business entity and open a job definition from the **Used By** tab, the job definition page doesn't display the information correctly. Workaround: To view the correct information, open the job definition from the **Explore** page.
MDMN-103113	When you import a predefined business entity to an organization from where you exported the business entity and provide a custom project path, the predefined Data Quality assets are saved in both the default and custom projects. Workaround: To avoid duplication of the predefined Data Quality assets, don't enter the custom project path when you import a predefined business entity.

October 2023 known issues

Issue	Description
MDMN-121153	If business entities have only numeric fields, the search operation using the search box might fail in business applications. The search operation fails when users enter a search value other than integers in the search box.
MDMN-121151	When you add an integrity check based on a business entity attribute, business entity record fields appear as attribute options in the **Add Integrity Check** dialog box. The issue occurs if there are at least three business entities and each business entity has a business entity record field relationship with another business entity.

September 2023 known issues

Issue	Description
MDMN-117835	In Operational Insights, when you filter the ingress job metrics based on the hierarchy or relationship asset type, the metrics don't appear.

August 2023 known issues

Issue	Description
MDMN-120863	When you filter by job types on the **My Jobs** page, the following issues occur: - The list of job types includes duplicate entries. - Some job type names aren't user-friendly and appear as internal template names.
MDMN-115737	Users with custom user roles can't delete business events.

Issue	Description
MDMN-116700	The data access rules with conditions on relationship attributes and related business entity attributes don't work as expected. These rules incorrectly authorize users to view records when conditions apply to multiple field groups or multiple related records.
MDMN-102490	In Operational Insights, the usage summary for MDM SaaS doesn't refresh. Workaround: After you initiate the summary refresh, wait for the estimated refresh time. You can then refresh the Overview page to view the latest usage summary.
MDMN-96242	If different state codes have the same values, the real-time address verification doesn't validate and populate values for the state fields because Reference 360 stores unique values for the code fields.

July 2023 known issues

Issue	Description
MDMN-114699 MDMN-140891	When a dependent picklist field in a record contains a null or an invalid value, you can't save any changes to the record. On the Record Details page, the Submit button appears disabled. Workaround: On the Record Details page, select a valid value for the dependent picklist field and submit the changes.
MDMN-110693	If data access rule names contain special characters or characters of languages other than English, you can't open the rules from the user role details page or the rules list page.
MDMN-110460	When you view the details of MDM SaaS jobs in the Operational Insights service, the data is inconsistent between the job instance and performance details panels.
MDMN-109916	When you view the performance details of MDM SaaS jobs in the Operational Insights service, the time taken for the jobs to complete appears inconsistent. The inconsistency appears on the job instance and performance details panels. Also, the performance details panel displays the end date and time of jobs that are running.
MDMN-106929	When you use the Create Master Record API to create a record without specifying required field values, the record is created without validation errors.

June 2023 known issues

Issue	Description
MDMN-113525	After users delete a value of a field in a field group that has uniqueness criteria configured, users can continue to see a value for the field. This issue occurs when you have another duplicate entry for the field group.

May 2023 known issues

Issue	Description
MDMN-105575	You can't configure data access rules or revoke read privilege to restrict access to record names for custom user roles. The record name appears in the title and description of tasks listed in the workflow inbox. The issue occurs if you configure the record name as the title and description for business events.
MDMN-102953	When you import a business entity that has DaaS rule associations and integrity checks along with its dependent objects into another organization, the import process fails. The issue occurs when you override the existing assets during the import process. Workaround: Import the business entity, and then the dependent objects without overriding any existing assets.

February 2023 known issues

Issue	Description
MDMN-98400	When you download translation files, some translations in the files might not apply to your business applications. Workaround: Ignore the translations that aren't applicable.

January 2023 known issues

Issue	Description
MDMN-94729	When you run an ingress job to import data with integer fields, and if the value of an integer field exceeds the maximum limit of 2147483647, the ingress job fails. Workaround: Use text fields instead of integer fields if the value of an integer field exceeds the maximum limit and run the job again.

December 2022 known issues

Issue	Description
MDMN-100733	In an organization that uses real-time address enrichment, when the users edit any address on the **Workflow Inbox** page, the business application doesn't enrich the address of the records in real time.
MDMN-93837	When you run egress jobs to export large number of hierarchy records, if the hierarchy data has duplicate relationships, the number of exported records varies in each run of the egress job.

November 2022 known issues

Issue	Description
MDMN-91206	On the My Jobs page, the status of completed egress jobs might incorrectly appear as running.
MDMN-90345	You can't export a large number of records if the size of each record exceeds 2.5 MB for more than 1000 records in the data that you export. The egress job might fail with an out-of-memory error.

September 2022 known issues

Issue	Description
MDMN-87977	When you export a report from one organization and import the report to another organization, the imported report doesn't appear on the **Reports** page in Customer 360. Workaround. Export the Report Set asset from one organization and import the Report Set asset to another organization for the reports to appear in Customer 360.
MDMN-81951 MDMN-81950	When Informatica Global Customer Support users access your organization after you grant access, the Add, Delete, and Edit buttons appear enabled. However, the users can't save changes to the assets.

August 2022 known issues

Issue	Description
MDMN-83666	When you export data from a business entity that contains nested field groups, you cannot identify the parent field group for each child field group in the exported data. Workaround: To identify the parent field group, manually refer to multiple files in the exported data and then associate the `parentId` value of the child field group with the `sourcePkey` value of the parent field group.
MDMN-81285	When you enable source control in Administrator, the following processes might fail: - Upgrading business applications - Importing and exporting assets

June 2022 known issues

Issue	Description
MDMN-79435	You aren't warned when you manually merge records that belong to different populations.
MDMN-78101	Even though users with custom user roles aren't assigned the Business360ProcessExecutor role in Administrator, these users can access the option to create hierarchies in the business applications. When these users try to create a hierarchy, the following error occurs: `Cannot create the hierarchy <hierarchy name>.` Workaround: To enable users with a custom user role to create hierarchies, assign the privileges for creating hierarchies on the **Security** page and the Business360ProcessExecutor role in Administrator.

May 2022 known issues

Issue	Description

MDMN-71954	For a custom user role, the read privileges that you assign for a hierarchy and its associated relationships and business entities do not work as expected. When a user with the custom user role tries to view the hierarchy record in the business application at a specific point in time, the user gets the following errors:
	`Authorization cannot be granted.`
	`Cannot find history data for this hierarchy at given point in time.`

April 2022 known issues

Issue	Description
MDMN-71748	If you enable the delete privilege for a business entity on the Security page, the delete and cut icons for the custom fields are not enabled on the **Attributes** tab of that business entity as expected.

March 2022 known issues

Issue	Description
MDMN-71008 MDMN-68427	If you import an egress job that exports hierarchy or relationship data to a target organization, the import job fails with the following error: `Metadata object with id: <hierarchy name>/<relationship name> was not found!` Workaround: Create an egress job in the target organization and add the associated taskflow that exports hierarchy or relationship data.

February 2022 known issues

Issue	Description
MDMN-68378	When you run an ingress job to import more than 300,000 records into a data model that contains more than 20 field groups, the ingress job fails. Workaround: Use a taskflow that contains mappings with individual source object for each field group.
MDMN-68091	After you select a taskflow in an egress job, the **Record Type** and **Source System** columns do not appear as lists. Workaround: Click the **Record Type** and **Source System** column values to view them as lists and select the required option.
MDMN-67134	On the **My Jobs** page, the search box on the **Job Instances** tab fails to retrieve the job instances if you use a job type value as the search text. The search box on the **Job Schedules** tab fails to retrieve the job schedules if you use a status as the search text. Workaround: To find job instances and job schedules based on the job type or status values, use the filter option.

December 2021 known issues

Issue	Description
MDMN-64722	The search box in a custom page does not work as expected when you configure the following user interface elements: - Page header fields - Education field group - Display fields of the business entity
MDMN-64290	When you add a taskflow to an export job, the complete names of source systems might not appear due to space constraints. Workaround: Hover over a source system name to view its complete name.

August 2021 known issues

Issue	Description
MDMN-56720	A custom user role with the read privilege to access the **Match** tab of a business entity can perform edit and delete tasks on the **Match** tab.
MDMN-56464	The attribute names that you can use in the REST API requests are case sensitive. (August 2021)
MDMN-53702	For a custom user role, if you assign the create and read privileges to the attributes of a predefined business entity, the create privilege does not work as expected. When the user creates custom fields and saves the business entity, the following error occurs: `Metadata authorization error.` Workaround: Assign the update privilege for the business entity attributes in addition to the create and read privileges.

Issue	Description
MDMN-53519	When you run an ingress job that processes records with multiple value fields, and both updates and deletes are part of the process, the process deletes records but ignores updates to the records.
MDMN-50082	You can't delete custom smart fields even when they don't contain dependencies.
MDMN-49897	You can't delete fields and field groups of custom business entities that were previously used in custom pages.

July 2021 known issues

Issue	Description
MDMN-58420	When you create a business entity field with display name ending with colon (:), the field label does not appear in Customer 360.
MDMN-47638	When you render the Alternate Names field group as a card in a custom page, the page validation does not work as expected.

December 2020 known issues

Issue	Description
MDMN-38312	When you configure a custom page, if you add a custom field group that does not allow multiple instances, the field group do not work as expected in Customer 360.
MDMN-38216	If you configure fields to allow multiple values, the fields do not appear in Customer 360. Workaround: Delete the multiple value fields, and then create the fields again as single value fields.
MDMN-37147	When you manually stop or pause a running job, the job status might not update in the **My Jobs** page.

MDM SaaS Extensions

Fixed issues

There are no fixed issues in this release of MDM SaaS extensions. Not all monthly releases include fixed issues.

Known issues

The tables in this section describe known issues for MDM SaaS extensions. Not all monthly releases include known issues.

February 2024 known issues

Issue	Extension	Description
CNXT-2612	Life Sciences extension for Customer 360 SaaS	If you deployed the extension before February 2024, enrichment assets of MedPro Systems are not imported during asset migration from one organization to another. Workaround: To import the updated enrichment assets bundle, ensure that you have the Admin user role. To use the updated enrichment bundle assets of MedPro Systems, contact Informatica Global Customer Support.

August 2023 known issues

Issue	Extension	Description
MDMN-114311 MDMN-117603	ESG extension for Supplier 360 SaaS	After you import the extension assets with the Designer user role, you can't view the custom pages and the search component. Workaround: To view the custom pages and the search component, a user with the Admin user role can add them to the Supplier 360 business application. After you import the assets, add the pages and search component to the Supplier 360 business application with the administrator user role.

April 2023 known issues

Issue	Extension	Description
MDMN-107301	Life Sciences extension for Customer 360 SaaS	After you enrich a Customer 360 record with a MedPro Systems record, you can't enrich the Customer 360 record again. The enrichment fails with an incorrect update error.

February 2023 known issues

Issue	Extension	Description
MDMN-97919	Legal Entity Master extension for Customer 360 SaaS	When you select a value from a picklist with more than 1000 code values, the following error appears: `You do not have permission to view the values from this list. Contact your administrator to review your permissions.` Workaround: Decrease the picklist limit to 1000 code values.

January 2023 known issues

Issue	Extension	Description

MDMN-97844	Legal Entity Master extension for Customer 360 SaaS	When you enable Data Quality rules and search the GLEIF database to enrich a Customer 360 record, the enrichment fails with the following error:
		`"errorDetail":{"details":[`
		`{"code":"BES.00081.7","message":"Failed executing RuleAssociation","localizedMessage":"Failed executing RuleAssociation","path":[],"rawErrorDetails":[]}`
		`]}`

MDMN-97235	Legal Entity Master extension for Customer 360 SaaS	When you enter the enrichment criteria to enrich a Customer 360 record and search the GLEIF database, the following error appears: `Something went wrong when we tried to render this page.` The issue occurs when the search doesn't return any matching data.

December 2021 known issues

Issue	Extension	Description
CNXT-521	Salesforce extension for Customer 360 SaaS	In an organization that uses Salesforce extension with real-time synchronization, the history feed in Customer 360 displays all the fields for a record as updated instead of displaying only the updated fields.

November 2021 known issues

Issue	Extension	Description
CNXT-469	Salesforce extension for Customer 360 SaaS	In an organization that uses Salesforce extension, import a hierarchy from Salesforce to Customer C360. If you now change the root node of the hierarchy in Salesforce and try to import the hierarchy again, a new hierarchy is created instead of updating the existing hierarchy. Workaround: Delete the previous instance of the hierarchy in Customer 360.

Informatica Global Customer Support

You can contact a Global Support Center through the Informatica Network or by telephone.

To find online support resources on the Informatica Network, click **Contact Support** in the IDMC Help menu to go to the **Cloud Support** page. The **Cloud Support** page includes system status information and community discussions. Log in to Informatica Network and click **Need Help** to find additional resources and to contact Informatica Global Customer Support through email.

The telephone numbers for Informatica Global Customer Support are available from the Informatica web site at https://www.informatica.com/services-and-training/support-services/contact-us.html.
