Read the *Informatica® Customer 360 for Salesforce Release Notes* to learn about the fixed limitations and known limitations of the release.

Fixed Limitations

The following table describes fixed limitations:

Reference Number	Description
CC-3450	When you use a non-Admin profile to create Contact objects with standard setup with Account, the contact creation fails with insufficient privilege on Account fields.
CC-3425	When you perform a fuzzy match between two accounts, the fuzzy match fails for custom objects that have the synchronization settings name starting with `Accounts`. For the Account synchronization settings, you get the following sample error: `Error: Schema Definition is null for Account or field City__c`

CC-3391	When you run the DaaS Migration API after you upgrade from 6.53 to version 7.x, the API fails with the following error:
	`Line: 1853, Column: 1`
	`DSE.DS_Classes.CC360Exception: Error: Schema Definition is null for DS_Adapter_Request_Settings_c or field DS_Field_Name_c`

CC-3390	When you run a merge job for records with fields that use the oldest or the latest updated non-null record value settings, you can't retain values from the master record if the master record value is not null.
CC-3384	You can't configure the field sets for a person account using the Person Account Field Set setup tool in the Setup Wizard.
CC-3275	In Lightning Experience, if you select records for a manual review and merge after you run a duplicate batch job, the merge rules don't apply correctly.

Known Limitations

The following table describes known limitations:

Reference Number	Description
CC-3263	In Lightning Experience, if you select records for a manual review and merge after you run the duplicate batch job, the merge rules based on creation date might not apply correctly. Workaround: You must manually select the master record and field values for the merge process.
CC-3259	In Lightning Experience, when you run a duplicate batch job for a cluster with duplicate records more than the segmentation limit, the match scores might not appear and the Manual Review flag might reset. Workaround: You can increase the segmentation limit for the batch job.
CC-2863	In Lightning Experience, when you try to get a consolidated view of a person account, the following error occurs: `Attempt to de-reference a null object` Workaround: Perform the following tasks: 1. Go to **Setup** > **Object Manager**. 2. Select **Master Bean** > **Field Sets** > **Master Bean Detail Fields**. 3. Add the Account field to the field set. 4. Click **Save**.
CC-2848	In Lightning Experience, when you run a DaaS batch job after you merge duplicate records, a null pointer exception appears. Workaround: Perform the following tasks: 1. Open the merged account. The account details page appears. 2. In the **Event Queues** section, click the down arrow against the event queue entry, and select **Delete**. 3. Run the DaaS batch job.
CC-2810	When you search for duplicate records, the result shows current record as a duplicate record.
CC-2270	In Lightning Experience, when you hover over a hierarchy node above level 25, the information summary of the node does not appear completely.
CC-2221	In an account page that uses the Lightning hierarchy component, when you edit a hierarchy, if you refresh the browser, you get the following error message: `A Component Error has occurred!` You can close the error window and then open the account page again. Workaround: To refresh the hierarchy, use the **Refresh** icon in the Hierarchy section.
CC-2197	In a person account-enabled organization, after you edit a hierarchy, the hierarchy specific fields of the impacted accounts are not updated. Workaround: 1. Open the synchronisation settings of the person account object. 2. If you have any boolean contact custom fields mapped, map them to text fields.
CC-1822 CC-1820	In the Lightning Scout pages, the state, country, and multi-select picklist fields do not display their default values.

Reference Number	Description
CC-1537	In Lightning Experience, if you edit a hierarchy, you might not get the expected results. Workaround: Use Salesforce Classic to edit hierarchies.
CC-1536	In Lightning Experience, under **Consolidate View** > **Data Sources**, if you use the default **Bean List Fields** field set, the records fields with the highest priority in the data source settings are not highlighted. Workaround: Perform the following tasks: 1. Go to the Setup Wizard. 2. Click **Field Sets**. 3. Under the **Bean Field Sets** section, perform one of the following tasks: - Configure the **Bean List Fields** field set. - Override the default **Bean List Fields** field set.
CC-473	When two or more potentially matching records are concurrently added, the matching job that runs synchronously might return the following error message: `UNABLE_TO_LOCK_ROW, unable to obtain exclusive access to this record` You can safely ignore the error message.
CC-345	If you set the time delay of suggestions to appear from the address verification service to a value lower than the default value of one second, multiple calls might be made to process one address. If the number of calls exceeds the maximum tries allowed, the address verification service considers it a new transaction. Workaround: From the Setup Wizard, increase the time delay for the address suggestions to appear.
CC-342	If the data from the Salesforce object fields exceeds the size of the service fields to which they are mapped, the DaaS job fails when processing such requests. Workaround: Adjust the mapping of the Salesforce object fields to the service fields.
CC-333	You can create multiple DaaS job templates with the same name.
CC-302	When you create a Data as a Service (DaaS) job template, if you select a Boolean, Double, Integer, Percent, Date, DateTime, or Currency field as a column filter and do not specify a value for the field, you get the following unclear error message: `expecting a colon, found ')'` Workaround: Specify a value for the field.
CLD-1412	When you search for nodes in a hierarchy, you do not get any result if the selected root node is an external bean and the hierarchy has some account beans. Workaround: Select an account bean in the hierarchy and search for nodes in the account page of the selected bean.
CLD-1227	When you run the duplicate bean check job, you get the following error: `duplicate value found: DSE__DS_Pair_ID__c duplicates value on record with id: a1AC0000007hxqS` Workaround: Reduce the query limit.
CLD-989	CC360 does not support relationship fields in field sets. However, a few hierarchy field sets can use relationship fields for display purposes.
CLD-790	During asynchronous hierarchy cloning recovery, CC360 does not update the number of beans field in a master bean.

Reference Number	Description
CLD-789	If cross pairs exist in duplicates and you run the Merge Accounts batch job, the Items Processed field displays an incorrect count.
CLD-714	A failed batch job might remain with Running status in the batch queue manager. Workaround: CC360 sets the batch job status to Failed after five minutes.
CLD-667	Asynchronous batch processing can stop responding during a hierarchy split operation, an ultimate parent name change operation, or a hierarchy type change operation for hierarchies with more than 100 levels. If Apex debug logs are enabled, the following error appears in the logs: `'FATAL_ERROR|Internal Salesforce.com Error'` Workaround: Decrease the Hierarchy Batch Size Limit parameter in the Data Scout custom settings.
CLD-519	When you rename the company name of a node that is within a branch that you have moved and asynchronous hierarchy processing is not complete, the following error might infrequently occur: `Account Update: Hierarchy update in-progress. Please wait till hierarchy Sync completes.` Workaround: Change the company name after the current batch chunk processing completes.
CLD-625	If you have comparison log generation enabled, you might encounter the UNABLE_TO_LOCK_ROW issue when you run the Duplicate Check batch job and Matching batch job simultaneously. Workaround: Rerun the batch jobs. Allow one batch job to complete before you launch the other batch job.
CLD-550	You cannot delete the root node of a large hierarchy. Workaround: Remove all the child nodes of the root node from the hierarchy. You can delete the root node after it is a standalone node.
CLD-399	When you migrate contacts and leads, only the first portion of the fuzzy segment is created. Workaround: Disable **Quick Cleansing** in the **Synchronization Settings** during the initial data load and during migration.

Informatica Global Customer Support

You can contact a Global Support Center by telephone or through the Informatica Network.

To find your local Informatica Global Customer Support telephone number, visit the Informatica website at the following link:
https://www.informatica.com/services-and-training/customer-success-services/contact-us.html.

To find online support resources on the Informatica Network, visit https://network.informatica.com and select the eSupport option.
