Abstract

This document tells you how to connect the elements in a Russian Federation address to the appropriate address elements in Informatica Address Verification. This document also describes best practices that you can implement when you verify addresses in the Russian Federation.

Supported Versions

- Informatica Address Verification (On-Premises and Cloud) 6.0.and later

Input and Result JSON in Address Verification (On-Premises)

The following example shows how you can map the address information to the JSON address elements in Address Verification (On-Premises).

You enter the following input address:

```
{
  "Parameters": {
    "Mode": "Batch",
    "CountryDetermination": {},
    "DataSetDetermination": {},
    "CountrySets": [
      {
        "Process": {
          "AlternativeHandling": {},
          "VerificationLevel": {
            "PreferredVerificationLevel": "All",
            "MinimumVerificationLevel": "All"
          },
          "Geocode": { "SearchRadius": "50" },
          "Enrichments": {
            "Geocoding": {
              "Rooftop": false,

Input and Result JSON in Address Verification

The following example shows how you can verify an Russian Federation address in a REST call to Address Verification.

You submit the following request:

```
{
    "Login": "******",
    "Password": "******",
    "UseTransactions": "Test",
    "CampaignId": "",
    "Request": {
        "Parameters": {
            "Mode": "Batch",
            "CountryDetermination": {},
            "DataSetDetermination": {},
            "CountrySets": [
                {
                    "Process": {
                        "AlternativeHandling": {},
                        "VerificationLevel": {
                            "PreferredVerificationLevel": "All",
                            "MinimumVerificationLevel": "All"
```

```
                    },
                    "Geocode": {
                        "SearchRadius": "50"
