Preface

Read the Informatica *Address Verification (On-Premises) Database Release Guide* to learn about the monthly database updates in Informatica Address Verification (On-Premises).

CHAPTER 1

Informatica Address Verification Reference Database

This chapter includes the following topics:

- Overview, 7
- Types of Reference Data, 7
- Reading the Reference Database File Names, 8

Overview

Informatica reference databases are database files that contain reference data for the countries and territories that Informatica Address Verification supports.

Informatica releases the reference databases every month with new updates. The updates for some months may contain new postcodes, enhanced address outputs and more, while the updates for other months may contain regular maintenance updates. The list of countries may change with the database releases each month.

To download the database files, log in to https://dqc.addressdoctor.com/SSO/Default, and select the Database Download Manager option. For more information about how to download the reference database files, see *Database Download Manager* guide.

Types of Reference Data

Address Verification provides the following types of reference database file:

- AddressCodeLookUp data
- Batch and Interactive data
- Certified data
- QuickCapture data
- Geocoding data
- CAMEO data

- Supplementary data

You can download the reference databases from the Database Download Manager web page, or you can install the Database Download Manager client application to download the databases.

Reading the Reference Database File Names

The database file names have the following format:

```
<ISO3>_<Function>_<ProcessType>_<ProcessSubType>_<DataSetID>_<MinVersion>.MD6
```

For example, the database file name for Germany is `DEU_ADV_VRF_BIA_001_6_1_0.MD6`.

Consider the following ways to interpret the file names:

- `ISO3` denotes the three-character ISO country code. For example, the ISO country code for Germany is `DEU`.
- `Function` denotes the name of the product. In the file name, `ADV` represents Address Verification.
- `ProcessType` denotes the type of process. In the file name, `VRF` represents Verification, `ENR` represents Enrichment, and `RLK` represents Reverse Lookup.
- `ProcessSubType` denotes the process mode for which the file is intended or the type of data that the file contains.
  Consider the following list to identify the process modes:
  - `ACL` for AddressCodeLookup mode
  - `BIA` for Batch and Interactive modes
  - `Cxx` for Certified mode
  - `QCP` for QuickCapture mode
  - `GTA` for GeocodeToAddress mode
  - `GAP` for arrival point geocoding
  - `GRT` for rooftop geocoding
  - `GST` for street center, locality center, and postal code center geocoding
  - `CAM` for CAMEO data
  - `EN1` for supplementary data
- `DataSetID` denotes the data set ID value. The supported range is 000 through 999.
- `MinVersion` denotes the oldest version of Address Verification with which you can use the file.
  Consider the following format for `MinVersion`:

  ```
  <MajorVersion>_<MinorVersion>_<ReleaseVersion>
  ```

Note: You can view the reference databases, but you cannot modify them.
