Abstract

This document provides a high-level overview of the Informatica Address Verification, powered by AddressDoctor, support for France address verification. This document also contains information about best practices that you can implement to optimize France address verification.

Supported Versions

- Informatica AddressDoctor 5.16.5
- Informatica AddressDoctor Cloud 2.0.0

Language and Character Set

Because the reference address databases for France are in French, France addresses are available only in French.

The default character set for France addresses is Latin 1 - Western European.

Process Modes

You can process France addresses in the following process modes:

- BATCH
- CERTIFIED
- COUNTRYRECOGNITION
- FASTCOMPLETION
- INTERACTIVE
- PARSE

Informatica Address Verification verifies addresses in batch, certified, fast completion, and interactive modes.

In the certified mode, you can verify addresses in accordance with Service National de L'Adresse (SNA) certification from La Poste, the postal department of France.

Address Enrichments

You can configure Informatica Address Verification to return the following enrichments for the verified France addresses:

Enrichment	Database	Description
Arrival Point Geocoding	FRA5GCAP.MD	Retrieve the arrival point geocoordinates for valid France addresses. This is the default geocoding that Informatica Address Verification returns for valid France addresses if you enabled geocoding.
CAMEO	FRA5CA.MD	Retrieve the CAMEO profiles from the Callcredit Information Group as enrichment to valid France addresses. CAMEO profiles provide consumer classification systems that indicate the socio-economic and geo-demographic profiles of neighborhoods across the world.
Country-Specific Enrichments	FRA5E1.MD	Retrieve country-specific enrichments such as INSEE and INSEE-9 or IRIS codes as enrichments for valid France addresses.
Parcel Centroid Geocoding	FRA5GCPC.MD	Retrieve the parcel centroid geocoordinates for valid France addresses.
Standard Geocoding	FRA5GC.MD	Retrieve the standard, interpolated geocoordinates for verified France addresses.

Address Type Indicators for France Addresses

Informatica Address Verification returns the following address type values for France addresses:

- B. The address identifies a building.
- F. The address identifies an organization. The address does not include a CEDEX post code.
- G. The address is a general delivery address. The reference data does not contain a match for the street information. However, the reference data contains a match for the CEDEX postal code in the address.
- L. The postal code identifies the organization as a large volume receiver. The address might or might not contain an organization name. The reference data uses the CEDEX postal code to add or validate the organization name.
- P. The address identifies a Post Office Box or a delivery service.
- S. The address identifies a street address. S is the default address type. Address Verification returns the default value if it cannot determine the address type from the address data.
- U. Unidentified. The address is not valid, and Address Verification does not assign an address type.

If an address meets the criteria for more than one address type, Address Verification assigns the first applicable address type from the following list:

L, F, P, B, S, G.

Address Format and Address Examples

A typical address in France contains the following elements in the given order:

```
RECIPIENT
[APARTMENT] [BUILDING]
HOUSE_NUMBER [STREET_TYPE] STREET_NAME [DEPENDENT_LOCALITY]
POSTAL_CODE LOCALITY
FRANCE
```

The elements marked in square brackets, such as Apartment, Building, Street Type, and Dependent Locality, are optional. Informatica Address Verification verifies France addresses only up to the house number level.

The following table lists the France address elements and provides examples:

Address Elements	Example 1	Example 2
RECIPIENT	Informatica France	-
[APARTMENT] [BUILDING]	TOUR CB 21	APPARTEMENT 2 CHEZ MIREILLE COPEAU
HOUSE_NUMBER [STREET_TYPE] STREET_NAME [DEPENDENT_LOCALITY]	16 PLACE DE L IRIS, COURBEVOIE	25 RUE DE L EGLISE
POSTAL_CODE LOCALITY	92040 PARIS LA DEFENSE CEDEX	33380 MIOS
COUNTRY	FRANCE	FRANCE
Complete Address	Informatica France TOUR CB 21 16 PLACE DE L IRIS COURBEVOIE 92040 PARIS LA DEFENSE CEDEX FRANCE	APPARTEMENT 2 CHEZ MIREILLE COPEAU 25 RUE DE L EGLISE 33380 MIOS FRANCE

Key Address Elements

The following elements in a France address are very important for address verification:

- Street Name
- House Number
- Locality

Informatica Address Verification verifies France addresses up to the house number level.

Note: For France addresses that contain a PO Box (Boîte postale or BP) number, Informatica Address Verification requires only the PO Box number and Locality to verify the address.

Address Verification Best Practices and Notes

Note the following points when you verify France addresses:

- To verify an address in the certified mode, enter address elements in the following FormattedAddressLine format:

  Line 1. Organization identification or identity of the addressee.

  Line 2. Contact information or delivery point access information such as subbuilding number.

  Line 3. Delivery point location such as building name.

  Line 4. House or plot number and thoroughfare.

  Line 5. Delivery service or thoroughfare complementary identification.

  Line 6. Postal code and locality or CEDEX code and distribution area indicator.

  If you do not have any of these information, leave the corresponding address line empty.

- To verify an address in the certified mode, you must also set the following attributes of the `Result` element in `Parameters.xml`:

  - `PreferredScript` to ASCII_SIMPLIFIED.

  - `GlobalMaxLength` to 38 and the element-level `MaxLength` attribute to 0.

- To identify an address type, validate the street name along with either the locality information or the postal code in the fast completion process mode. Based on the address type information that Informatica Address Verification returns, enter address elements that are relevant for the type of address that you need to verify. For example, for an S type (street) address, add the house number and the dependent locality, if available, to the input address.

- La Poste does not support diacritical characters in France addresses. When you verify France addresses that contain diacritics in the certified mode, Informatica Address Verification removes the diacritics from the result output. For example, Informatica Address Verification returns Entree instead of Entrée and Batiment instead of Bâtiment.

- The last word of a street name in a France address has special significance when you verify France addresses. The matching algorithm that Address Verification uses for France address verification assigns additional weight to the last word of the street name.

- Of the five digits in a France postal code, the first two digits indicate the province (Department) to which the address belongs. The remaining three digits in the postal code identify the post office responsible for mail delivery in the locality.

- A CEDEX suffix in a France locality name identifies a large volume receive (LVR). CEDEX stands for *Courrier d'Entreprise à Distribution EXceptionnelle* or special business mail.
  Large organizations have unique postal codes assigned to them. Smaller organizations have one postal code that multiple organizations share. CEDEX suffix for bigger cities, such as Paris or Marseille, might also contain a number that identifies the delivery center. For example, 75442 CEDEX 09.

  Note: CEDEX mails receive special handling from La Poste. If you delete CEDEX from the address, the mail loses the special handling privileges that La Poste accords to business mail.

Frequently Asked Questions

Is province information available for France addresses?

Effective in March 2015 database update, Informatica Address Verification provides the province (Department) information for France addresses. Effective in Informatica AddressDoctor Version 5.7.0, Informatica Address Verification also provides the province part of the ISO 3166-2 code in the result output. The province part of the ISO 3166-2 code contains an alphanumeric string of up to three characters.

What is the maximum number of AddressLines in a France address?

According to the Universal Postal Union specifications, the maximum number of AddressLines in a France address is six. An international address can have a maximum of seven AddressLines.

How important is house number information in a France address?

House number is a required element in a valid France address. However, La Poste does not have the house number data for some of the addresses.

Reference Address Databases

Informatica updates the reference address databases for France every month. You can download the latest database packages from the Informatica Database Download portal.

Informatica Address Verification supports the following reference address databases for France addresses:

- `FRA5BI.MD`. For batch and interactive modes.

  Note: For the certified mode verification of France addresses, Address Verification uses the batch and interactive reference address database.
- `FRA5CA.MD`. For CAMEO consumer segmentation.
- `FRA5E1.MD`. For country-specific enrichments.
- `FRA5FC.MD`. For fast completion mode.
- `FRA5GCAP.MD`. For arrival point geocoding.
- `FRA5GC.MD`. For standard, interpolated geocoding.
- `FRA5GCPC.MD`. For parcel centroid geocoding.
