Abstract

This document provides a high-level overview of Informatica Address Verification, powered by AddressDoctor, support for the Netherlands addresses. This document also contains best practices information that you can implement to optimize the Netherlands address verification.

Supported Versions

- Informatica AddressDoctor 5.7.0
- Informatica AddressDoctor Cloud 2.0.0

Language and Character Set

Because the Netherlands reference address databases are in the Dutch language, the Netherlands addresses are available only in Dutch.

The default character set for the Netherlands addresses is Latin 1 - Western European.

Process Modes

You can process the Netherlands addresses in the following process modes:

- ADDRESSCODELOOKUP
- BATCH
- FASTCOMPLETION
- INTERACTIVE
- PARSE

Informatica Address Verification verifies addresses in batch, fast completion, and interactive modes.

Address Enrichments

You can configure Informatica Address Verification to include the following address enrichments in the verified Netherlands addresses:

Enrichments	Databases	Notes
Arrival Point Geocoding	NLD5GCAP.MD	Retrieve the CAMEO profiles from the Callcredit Information Group as enrichment to verified Netherlands addresses. CAMEO profiles provide consumer classification systems that indicate the socio-economic and geo-demographic profiles of neighborhoods across the world.
CAMEO	NLD5CA.MD	Retrieve the arrival point geocoordinates for verified Netherlands addresses. This is the default geocoding that Address Verification returns for valid Netherlands addresses if you enabled geocoding.
Parcel Centroid Geocoding	NLD5GCPC.MD	Retrieve the parcel centroid geocoordinates for verified Netherlands addresses.
Standard Geocoding	NLD5GC.MD	Retrieve the standard, interpolated geocoordinates for verified Netherlands addresses.

Address Format and Address Examples

A typical Netherlands address contains the following elements in the given order:

```
RECIPIENT
STREET_NAME HOUSE_NUMBER [APARTMENT][FLOOR]
POSTAL_CODE LOCALITY
NETHERLANDS
```

Informatica Address Verification verifies the Netherlands addresses to the house number level. Subbuilding information, such as apartment or floor, is optional.

The following table lists the Netherlands address elements and provides examples:

Address Element	Example 1	Example 2	Example 3
RECIPIENT	-	Informatica Nederland B.V.	Informatica Nederland B.V.
STREET NAME	Churchill-laan	Edisonbaan	-
HOUSE NUMBER	266	14a	-
[APARTMENT] [FLOOR]	III	-	-
POST BOX NUMBER	-	-	Postbus 116
POSTAL CODE	1078 GA	3439 MN	3430 AC
LOCALITY	AMSTERDAM	NIEUWEGEIN	NIEUWEGEIN

Address Element	Example 1	Example 2	Example 3
COUNTRY	Netherlands	Netherlands	Netherlands
Complete Address	Churchill-laan 266/ III 1078 GA AMSTERDAM Netherlands	Informatica Nederland B.V. Edisonbaan 14a 3439 MN Nieuwegein NETHERLANDS	Informatica Nederland B.V. Postbus 116 3430 AC Nieuwegein NETHERLANDS

From the examples 2 and 3 in the preceding table, you can see that the postal codes for street address and post box address are different even though both addresses point to the same address in the same locality. Typically, post box addresses map to postal codes that end with 0. Postal codes in the Netherlands contain either street addresses or post box addresses, but not both.

Key Address Elements

The following elements in a Netherlands address are very important for address verification:

House number

Postal Code

The combination of house number and postal code uniquely identifies an address in the Netherlands. Informatica Address Verification verifies the Netherlands address to the house number level.

Address Verification Best Practices and Notes

Note the following points when you verify the Netherlands addresses:

- To receive quick results with minimum input, validate the house number and postal code. Informatica Address Verification returns the address with street and locality information.
- To identify address elements that you need to enter to verify an address, validate the postal code in the interactive mode. Based on the address type result you receive, enter the required information. For example, if the address type is **S**, which denotes a street address, enter street name and house number. If the address type is **P**, which denotes a post box address, enter the post box number.
- A valid postal code in the Netherlands consists of four digits and two alphabets. Even though the four-digit numeral part of the postal code uniquely identifies a locality, the numeral part alone does not qualify as a valid postal code.
  Streets with four-digit postal codes are streets that were planned but were never built. For example, `Jachtvalk, 3905 Veenendaal` was planned in 1975, but was never built.
- There is no large volume receiver information for the Netherlands addresses.
- House numbers in streets begin from the center of the locality. If a street does not circle a locality, the house closest to the center of the locality has number 1. The house farthest from the center has the highest number. For example, `Amsterdamsestraatweg 1, 3513AA Utrecht` is close to the center, whereas `Amsterdamsestraatweg 1045, 3555HV Utrecht` maps to a different postal code.
- Typically, a house number such as 12A indicates one of the following:
  - A house that is next to house number 12. This occurs when a new house is constructed in the same premises that has a house with an already-assigned house number.
  - A house that is divided into two apartments. The first house receives the number 12, and the second one receives 12A as house number.

- Floor numbers in Amsterdam addresses are denoted by Roman numerals such as I, II, and III for 1st, 2nd, and 3rd respectively. Floor numbers in addresses from other parts of the Netherlands are indicated by English alphabets or Arabic numerals.
- In localities such as Arnhem and Nijmegen, house numbers contain two parts: the block number and the house number. For example, Lindenhorst 10-01 and Lindenhorst 10-02. In this example, Lindenhorst refers to the building area, 10 refers to the block number, and 01 and 02 refer to the house numbers. However, PostNL does not recognize the hyphen in these numbers and processes the numbers without the hyphen. For example, Lindenhorst 10-01 becomes Lindenhorst 1001.
- Not all postal codes in the Netherlands are currently used. Some of the postal codes are temporarily excluded and some others are reserved for future use.
- Post box numbers (Postbus in Dutch) map to specific postal codes. Typically, postal codes with a numerical part that ends in 0, such as 1000, identify post box addresses. For example, Postbus 1 through 50 in Amsterdam map to postal code 1000 AA.
- A postal code contains either street addresses or post box numbers, but not both.
- According to the Netherlands Government standards, the maximum length of a street name in the Netherlands is 43 characters.
- According to the NEN5825 standard, the maximum length of locality and street names in the Netherlands is 24 characters. If the length exceeds 24 characters, Address Verification abbreviates the names to meet the NEN5825 requirement of maximum 24 characters. If you do not want Address Verification to apply the NEN5825 standard, you can set the `ElementAbbreviation` attribute of the `Result` element in `Parameters.xml` to OFF. If you set `ElementAbbreviation` to OFF, Address Verification returns street names up to a maximum of 43 characters.

  Note: NEN5825 provides definitions and character set interchange formats for addresses in the Netherlands and applies to every regulated form of information exchange between organizations.
- According to PostNL, the maximum length of street names is 17 characters and the maximum length of locality names is 18 characters. However, Address Verification does not apply this limitation to street or locality names.
- According to NEN5825, the locality names must be in UPPERCASE letters. Street names can be in UPPERCASE or in Mixed Case.
  By default, Address Verification returns the Locality information in the address elements and address line elements output in UPPERCASE letters. Address Verification returns the street information in the address elements and address line elements output in Mixed Case. However, you can configure Address Verification to return the locality and street information in a casing of your choice. To specify the casing, set the `GlobalCasing` attribute of the `Result` element in `Parameters.xml` to an appropriate value.

  To receive the address complete output with casing that is compliant with NEN5825, set the `GlobalCasing` attribute to NOCHANGE. The Casing you specify for address elements, such as Locality and Street, or address line elements, such as FormattedAddressLine, takes precedence over the `GlobalCasing` setting.

Frequently Asked Questions

Is province information available for the Netherlands addresses?

Yes, province information is available for the Netherlands addresses. Effective in Version 5.7.0, Informatica Address Verification also returns the two-letter province ISO code in the result output.

What is the maximum number of AddressLines in a Netherlands address?

According to Universal Postal Union specifications, the maximum number of address lines in a Netherlands address is four. However, this does not include the country name.

Is house number information required to verify a Netherlands address?

Yes, house number information is required to verify a Netherlands address.

Do Netherlands addresses contain dependent street information?

No, the Netherlands address structure does not contain dependent street information.

Are there sublocalities in the Netherlands?

Yes, but the sublocality information is not required for address verification or postal delivery.

Reference Address Databases

Informatica updates the reference address databases for the Netherlands every month. You can download the latest database packages from the Informatica Database Download portal.

Informatica Address Verification supports the following reference databases for the Netherlands addresses:

- `NLD5BI.MD`. For batch and interactive modes.
- `NLD5FC.MD`. For fast completion mode.
- `NLD5CA.MD`. For CAMEO consumer segmentation.
- `NLD5GCAP.MD`. For arrival point geocoding.
- `NLD5GCPC.MD`. For parcel centroid geocoding.
- `NLD5GC.MD`. For standard geocoding.

For news about reference address databases and software updates for Address Verification, subscribe to the UpData newsletter from Informatica.
